LOOM

A music workshop for every kind of song — and for poems that want a sound.

User & Production Guide

What every control does, how a piece of music is made in LOOM, and how the machinery underneath works.

21 Troubleshooting

22 Limits, licences and credits

1 · What LOOM is

LOOM is a music studio that runs in a web browser. You write the notes, choose the sounds, shape the mix, record your voice, and share the result — but you can also start from a complete, editable song in a chosen style and change it until it is yours. Nothing is generated by a hosted AI service: the styles are written down as plain data and a small, deterministic generator, so a template does exactly what its description says and the same variation number gives the same song.

What it is good for

- **Songs of almost any style** — 64 ready-made styles (country, soothing acoustic, retro, jazz, hip hop, house, rock, world and more) and 44 drum beats to start from or ignore.
- **Poems and spoken word** — paste the words, choose a mood, and get a fitted music bed with no vocal part; read over it, let LOOM lower the music under your voice, export timed lyrics.
- **Sketching and arranging** — a piano roll, a drum step grid, a song timeline with named sections, and a mixer.
- **Showing your work** — a share link anyone can open without installing anything, with comments pinned to the exact second, a screen-and-voice walkthrough recorder and a searchable transcript.
- **Making it together** — invite people to edit a song with you; saves sync, and if two people save at once nothing is overwritten.

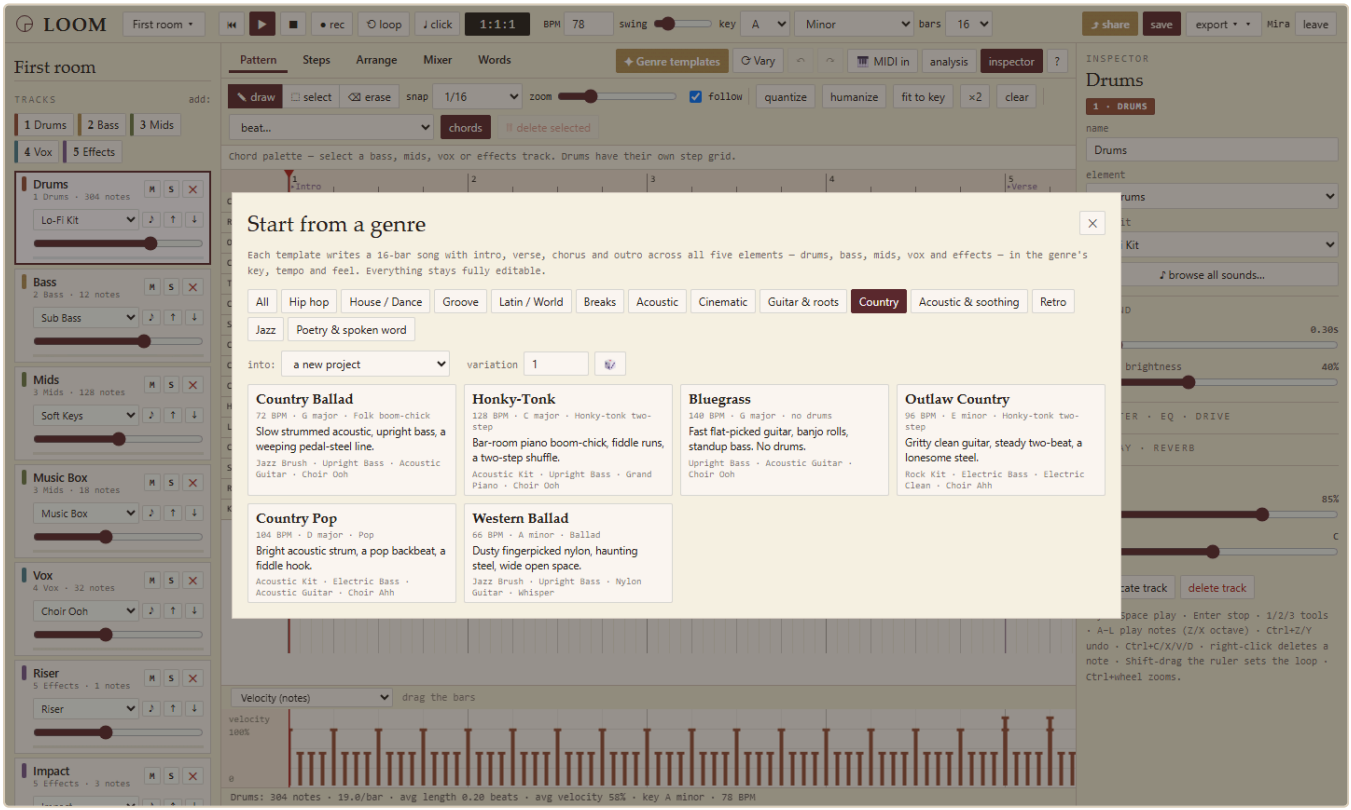

What it is not

- It is not a replacement for a full professional DAW: there are no third-party plug-ins, no multi-microphone audio editing, and the time signature is always 4/4.
- Sounds are a mix of **recorded samples** (piano, guitars, strings, real drum kits and more) and **synthesised** instruments. Recordings are a sparse selection that LOOM pitch-shifts, so they are good, not a full multi-sampled library.
- It cannot sing for you or read your poem aloud into the mix. Vocals are yours: record them or import a file.

> **HONESTY NOTE** The automated tests in this project render every instrument and every style through the real audio engine and check the numbers (loudness, silence, clipping, pitch, timing). A computer cannot judge taste: please listen, and tell the software what you would change.

2 · Quick start — a song in five minutes

1. **Open LOOM and create an account.** Go to the address where LOOM is running (locally: `http://127.0.0.1:8000`), choose *sign up*, and use a password of at least ten characters that is not based on your email. Your first project is created for you.
2. **Press play.** Your first project is a complete lo-fi song. Press `Space` or the ▶ button. The red playhead moves; the meters on the track cards dance.
3. **Pick a style.** Click ✦ **Genre templates**, filter by family (try *Country*), choose a card, and choose whether to create a new project or replace the tracks of this one. LOOM writes a 16-bar song — intro, verse, chorus, outro — across drums, bass, mids, vocals and effects.
4. **Change something.** Each track card has a sound dropdown. Switch the guitar to *Banjo*; click the ♪ button to browse and hear every sound before you choose. Press ⟳ **Vary** for a new take on the same style.
5. **Write a few notes.** In the **Pattern** view choose *draw*, click on the grid to add a note, drag its right edge to lengthen it. Click a chord such as *Am* in the chord palette to insert a whole chord at the dashed cursor.
6. **Save.** Press `Ctrl` + `S` (the dot on the save button means unsaved changes). Everything is stored in your project; history keeps the last 40 saves.
7. **Share.** Click ⤴ **share** then **Publish link**. Send the link: it opens, plays and takes comments with no account.

The genre-template dialog, filtered to the Country family. Each card shows tempo, key, beat and sounds.

> **TIP** You cannot break anything: every edit can be undone (`Ctrl` + `Z`, up to 100 steps), and deleting notes, tracks or clips shows an *Undo* button.

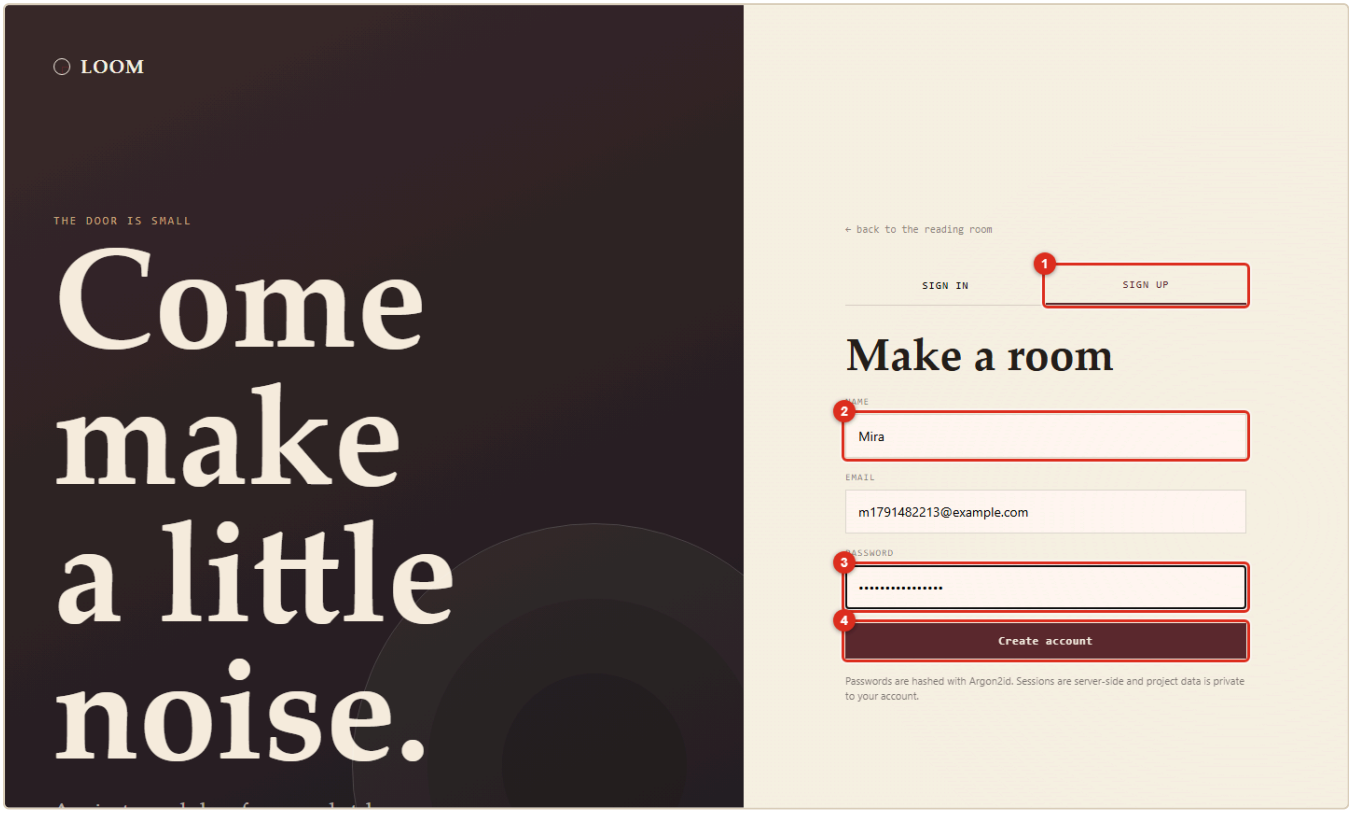

Tutorial · Step by step

Every step below shows the real studio with **red numbered boxes**; the numbers match the list under each picture. Do the parts in order the first time. Each step says what to do, what you will see, and gives one tip.

Part A · Your first song (about 5 minutes)

You will create an account, hear the starter song, build a country song from a template, and swap a sound.

Step 1 · Create your account

1 — Choose the **sign up** tab.

2 — Type a display name (at least 2 characters).

3 — Password: at least 10 characters and not based on your email.

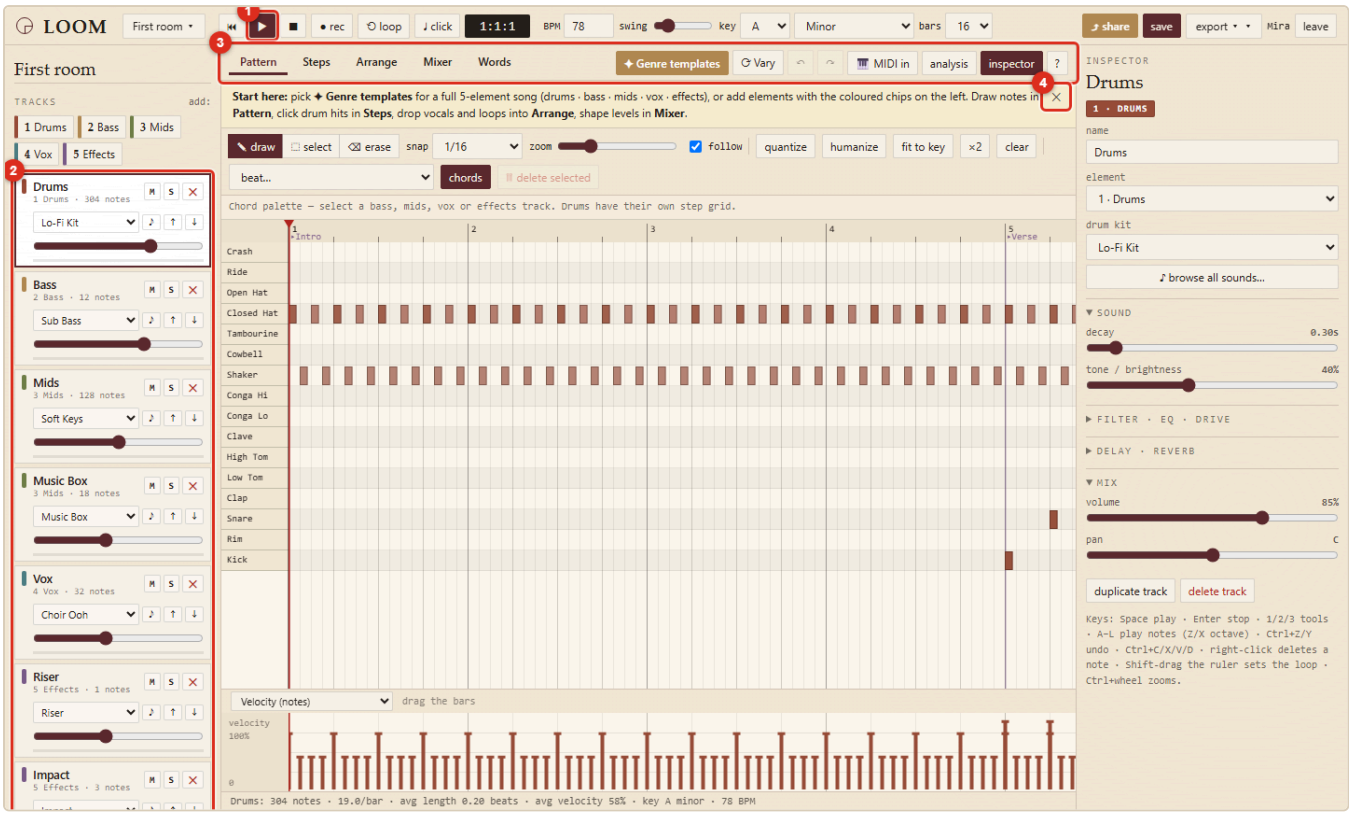

4 — Press the submit button.

Do this: Open LOOM in your browser (locally `http://127.0.0.1:8000`) and click **Start** / **Open the studio**, then fill in the form.

You will see: You land in the studio with a ready-made project called *First room*.

Tip: If you see a red message, read it: it names the field that was rejected.

Step 2 · Meet the studio

1 — **Play** button (also the `Space` key).

2 — **Track list**: Drums, Bass, Mids, Vox — one card per sound.

3 — **View tabs**: Pattern, Steps, Arrange, Mixer, Words.

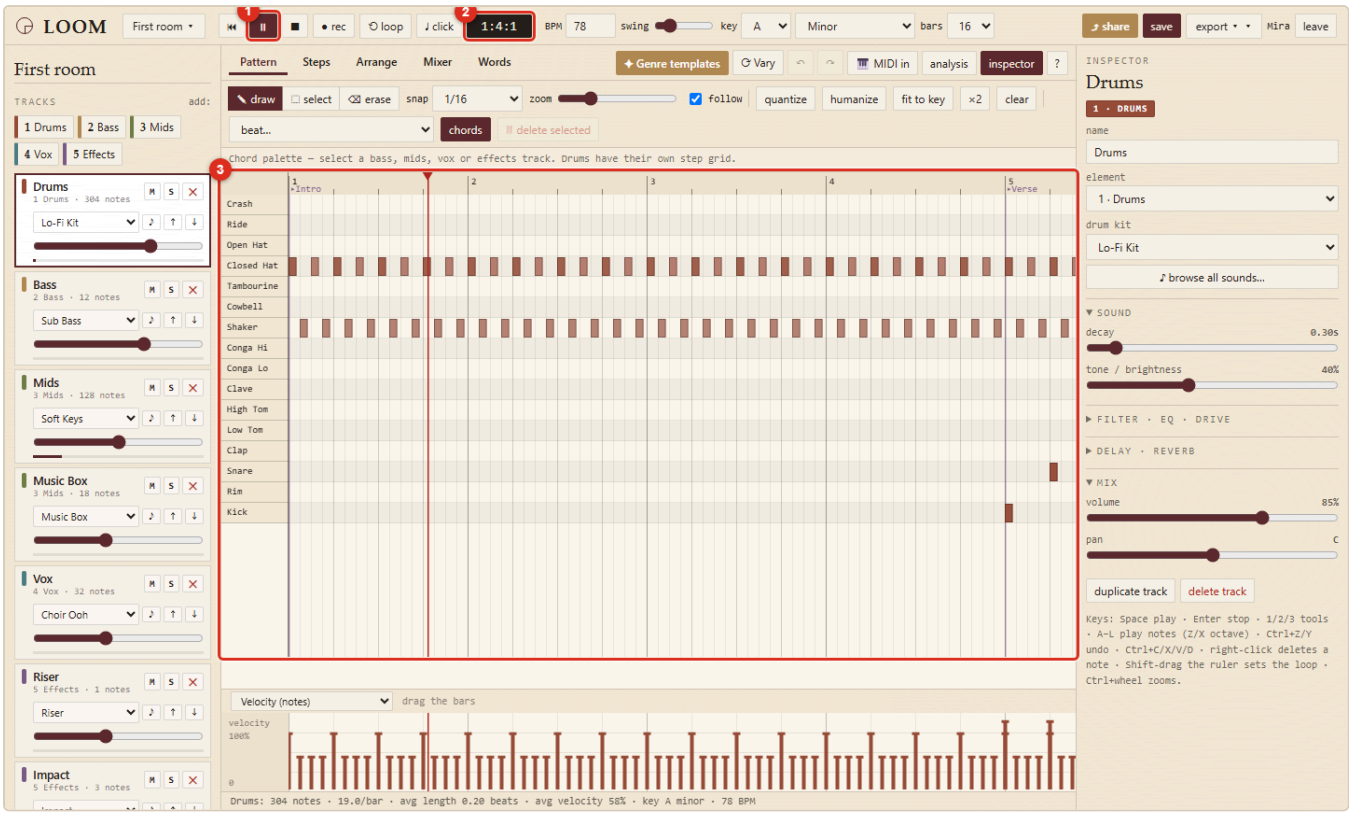

4 — Close the welcome hint with ×.

Do this: Look around before touching anything. The left column lists the tracks, the centre is the editing area for the selected view, the right column is the inspector for the selected track.

You will see: Nothing changes yet — this is just orientation.

Tip: Click the **?** button at any time for the shortcut sheet.

Step 3 · Press play

1 — Play / pause.

2 — Position read-out: bar : beat : sixteenth.

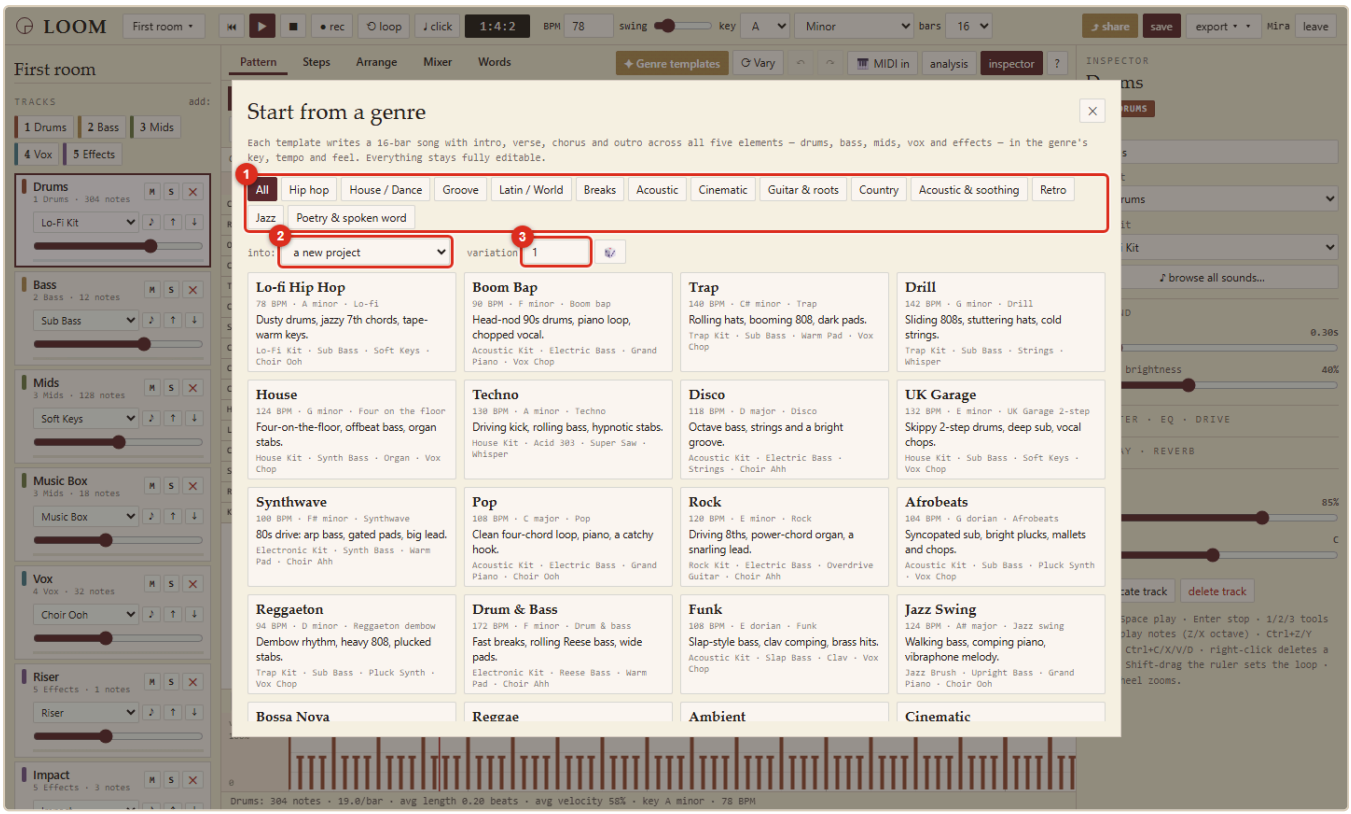

3 — The red playhead moves across the piano roll.

Do this: Click the play button or press `Space`. Press it again to pause; `Enter` stops and rewinds.

You will see: You hear the starter lo-fi song. Browsers only start audio after a click or key press, so if it is silent, press play once more.

Tip: Click on the ruler first to start from the middle of the song.

Step 4 · Open the genre templates

1 — Family filters (Country, Jazz, Retro …).

2 — **into:** new project or replace this project's tracks.

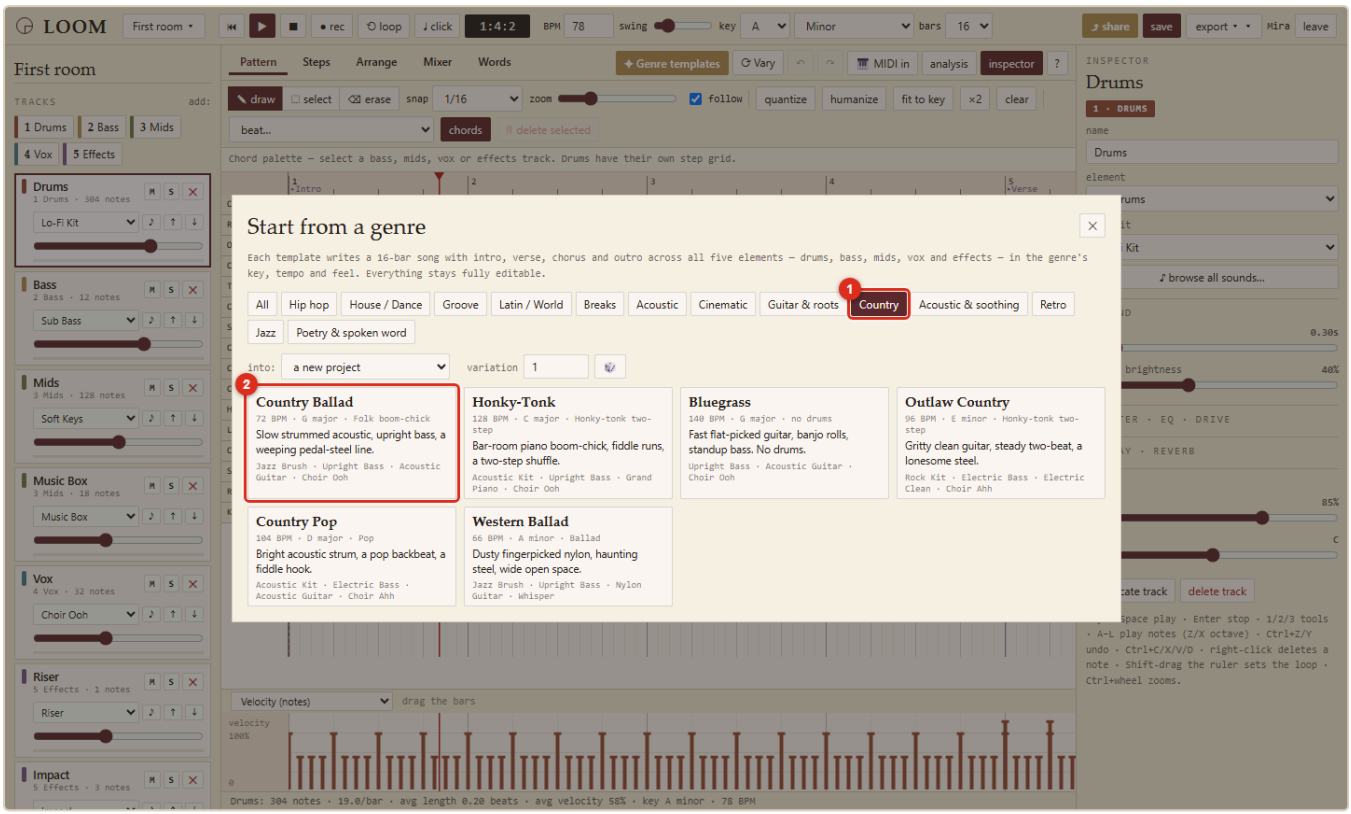

3 — **variation** number — the same number always gives the same song.

Do this: Click ✦ **Genre templates** above the editing area.

You will see: A dialog lists all 64 styles as cards with tempo, key, beat and sounds.

Tip: Leave *into* on "a new project" if you want to keep what you have.

Step 5 · Pick a country style

1 — Click the **Country** filter.

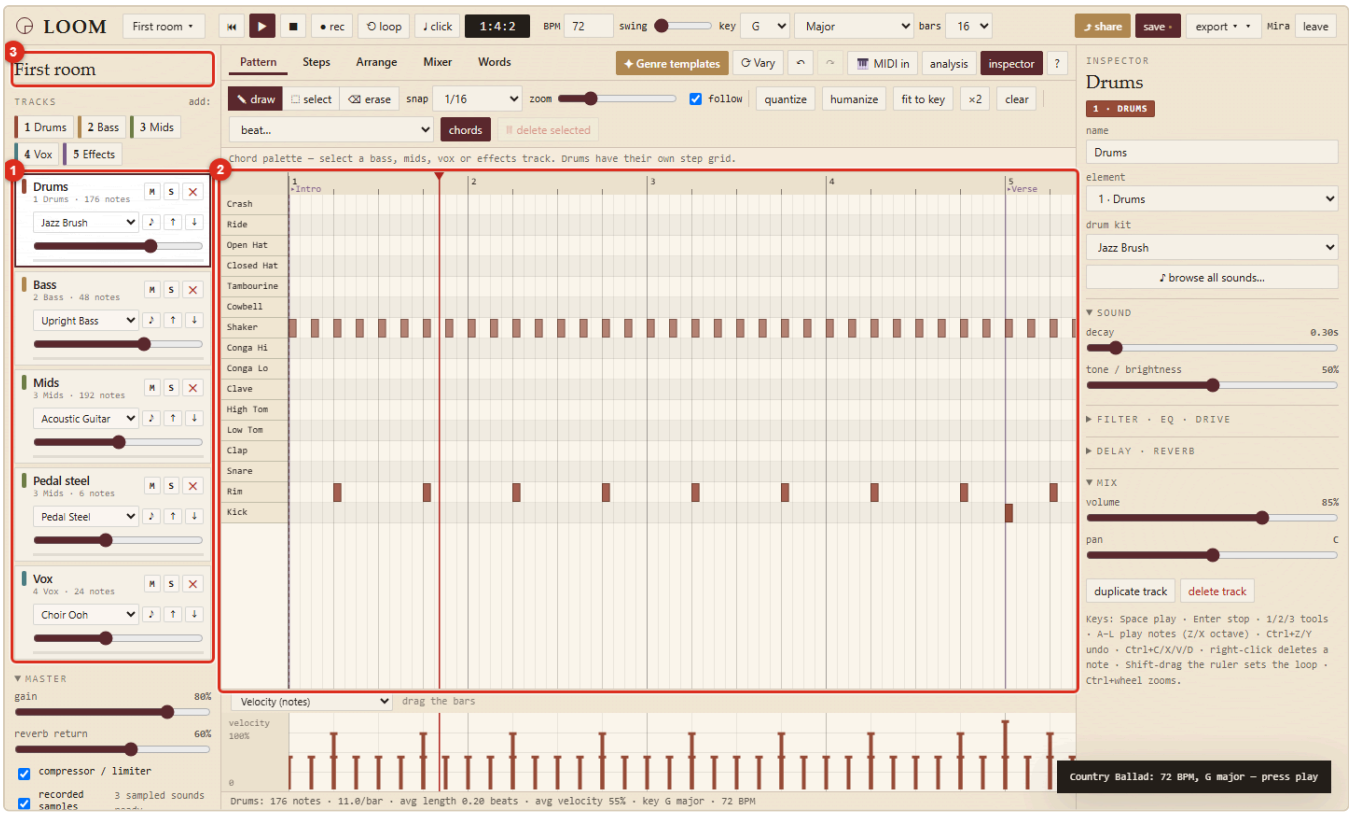

2 — Click the **Country Ballad** card.

Do this: Choose **replace this project's tracks** in *into*, then click the card.

You will see: LOOM writes a 16-bar song — intro, verse, chorus, outro — with drums, bass, acoustic guitar, pedal steel and vocals.

Tip: Not what you wanted? Press `Ctrl` + `Z`.

Step 6 · Listen and read what was built

1 — New track cards: each part has its own sound.

2 — Piano roll shows the selected track's notes.

3 — The project is named after the style.

Do this: Press `Space`. Click each track card to see its notes in the roll and its settings in the inspector.

You will see: A complete song you can edit note by note.

Tip: ⟳ **Vary** rewrites the notes with a new variation but keeps your sounds and mix.

Step 7 · Change a track's sound

1 — The selected track card.

2 — Sound dropdown — instant switch.

3 — ♪ opens the sound browser.

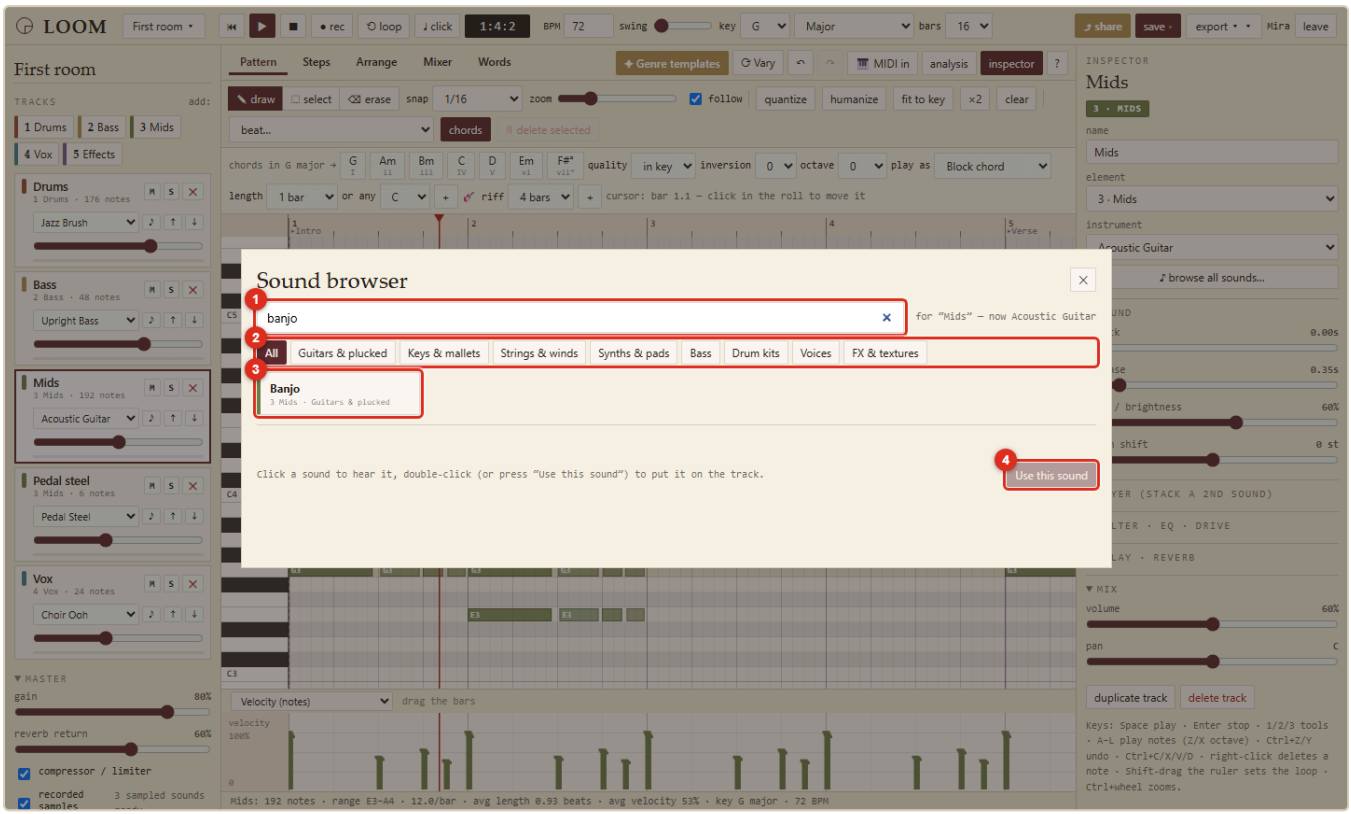

4 — Inspector: attack, release, tone, layer, EQ, effects.

Do this: Click the guitar track, then either pick a new sound from the dropdown or press ♪.

You will see: The notes stay; only the voice changes.

Tip: Choosing a sound from another element moves the track to that element.

Step 8 · Browse and audition sounds

1 — Search box (try “banjo”, “steel”, “rhodes”).

2 — Category tabs.

3 — Click a sound to hear it; double-click to use it.

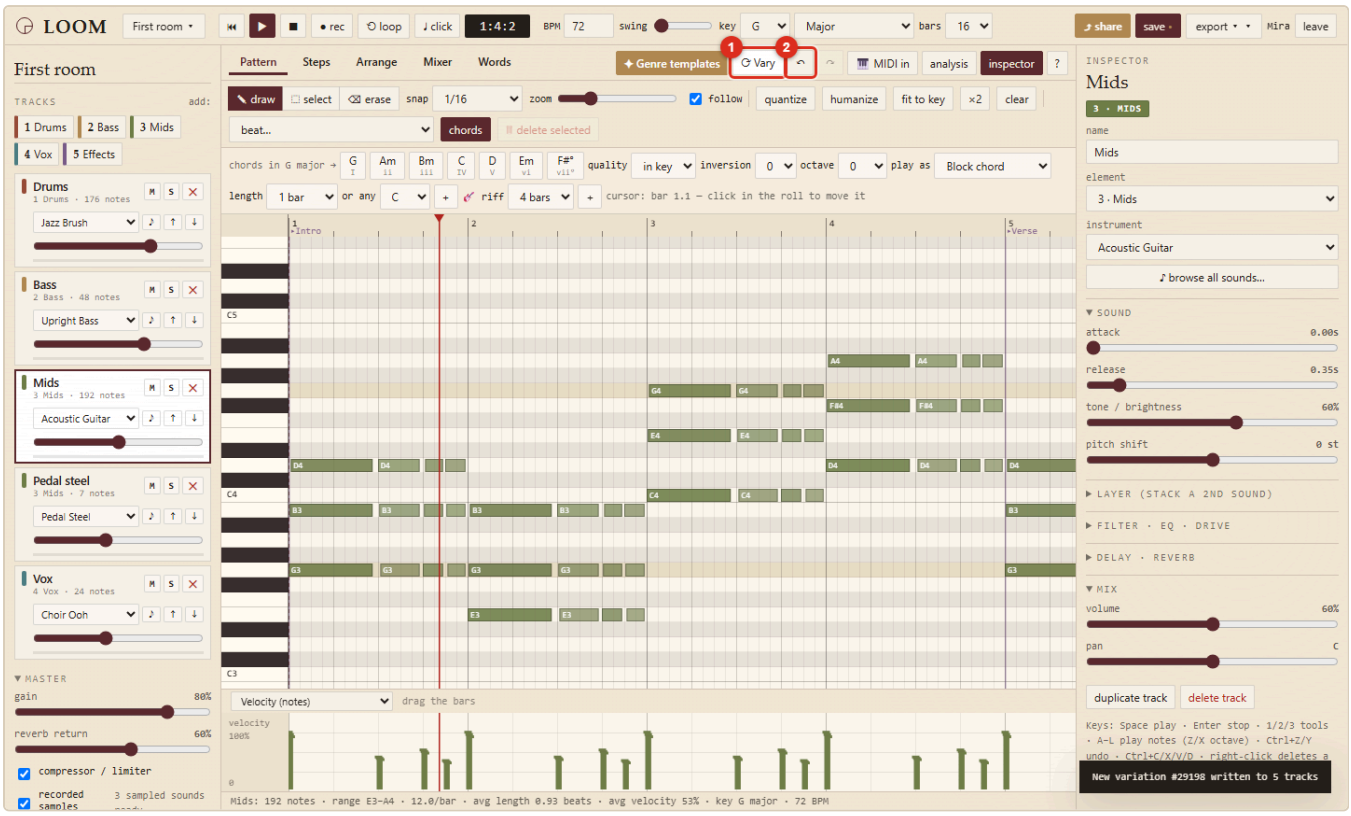

4 — **Use this sound** applies it to the track.

Do this: Single-click to audition — it plays a short phrase suited to that sound (a chord, a bass line or a drum pattern).

You will see: The track now plays the new instrument.

Tip: 77 sounds in all; 31 use real recordings when *recorded samples* is on.

Step 9 · Try another take

1 — **Vary** — new variation of the template.

2 — **Undo** — brings the previous version back.

Do this: Click ⟳ **Vary** a few times and listen to each result.

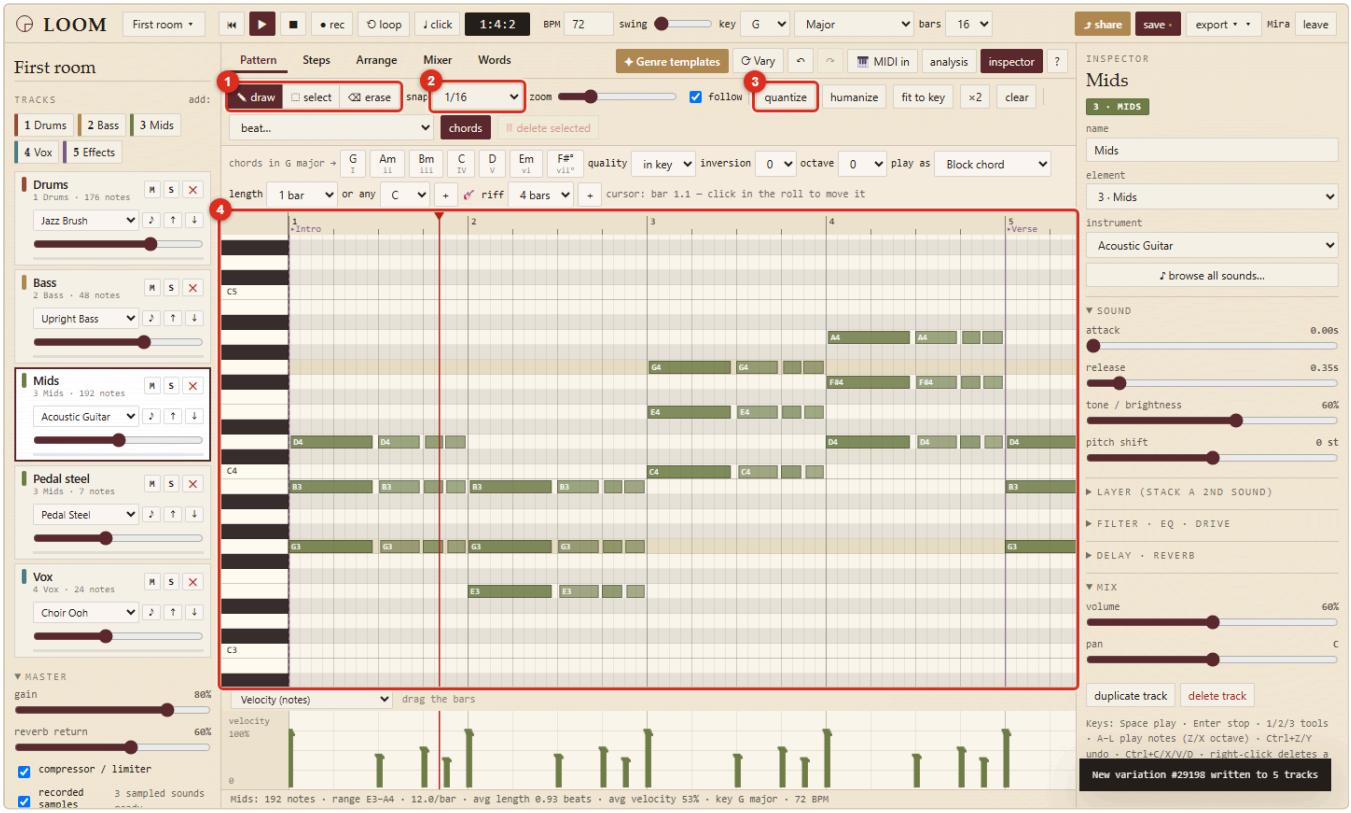

You will see: Fresh notes and rhythms in the same style.

Tip: Anything you drew by hand on non-template tracks is kept.

Part B · Writing and editing notes

Draw notes, drop in whole chords with strums, shape loudness and automate a filter.

Step 10 · The piano roll tools

1 — Tools: **draw**, **select**, **erase** (keys `1` `2` `3`).

2 — **snap**: grid resolution.

3 — **quantize**, humanize, fit to key, ×2, clear.

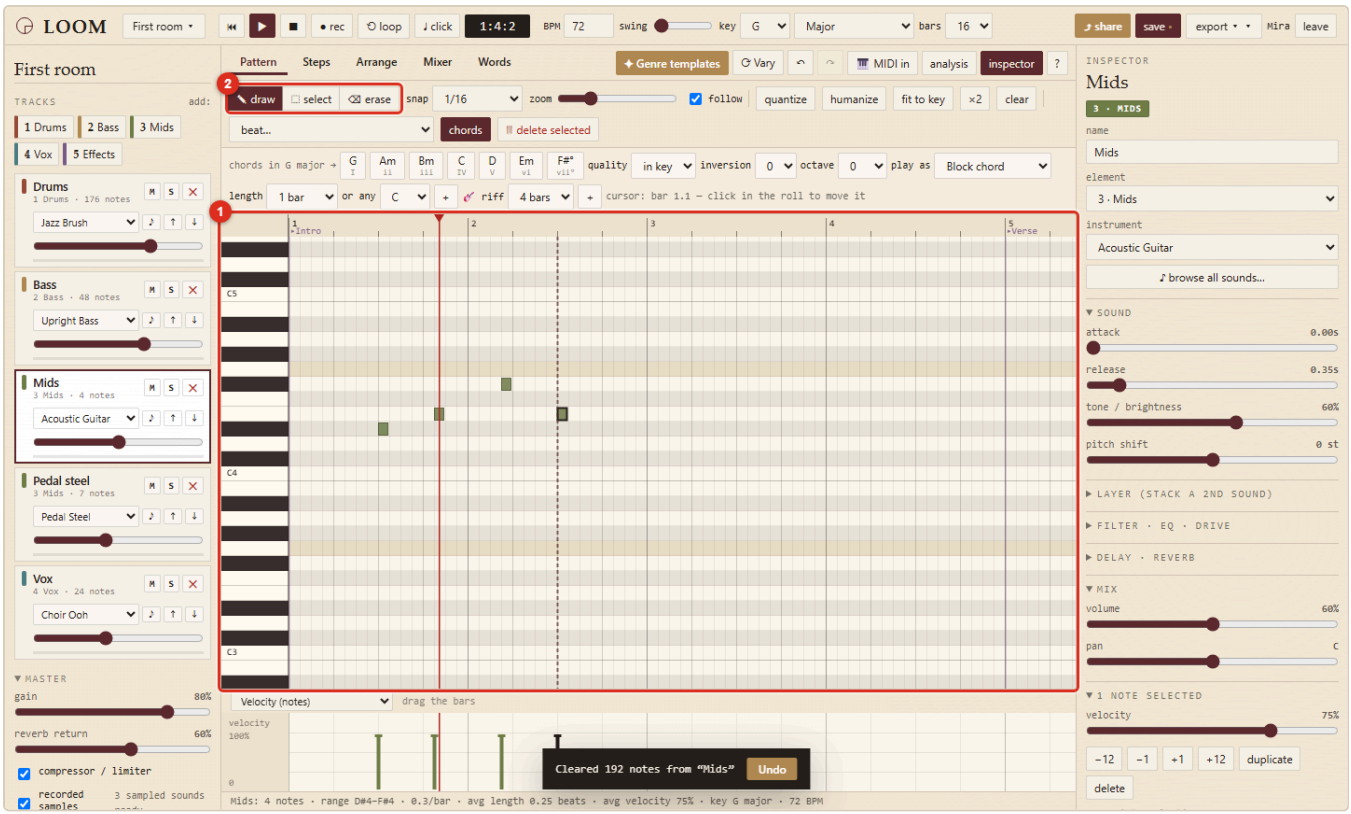

4 — The grid: time runs left to right, pitch bottom to top.

Do this: Click the **Pattern** tab and select a Mids track. The shaded rows are notes that fit your key.

You will see: You can already click the piano keys on the left to hear pitches.

Tip: `Ctrl`+wheel zooms the grid.

Step 11 · Draw notes

1 — Each green block is a note; its length is its width.

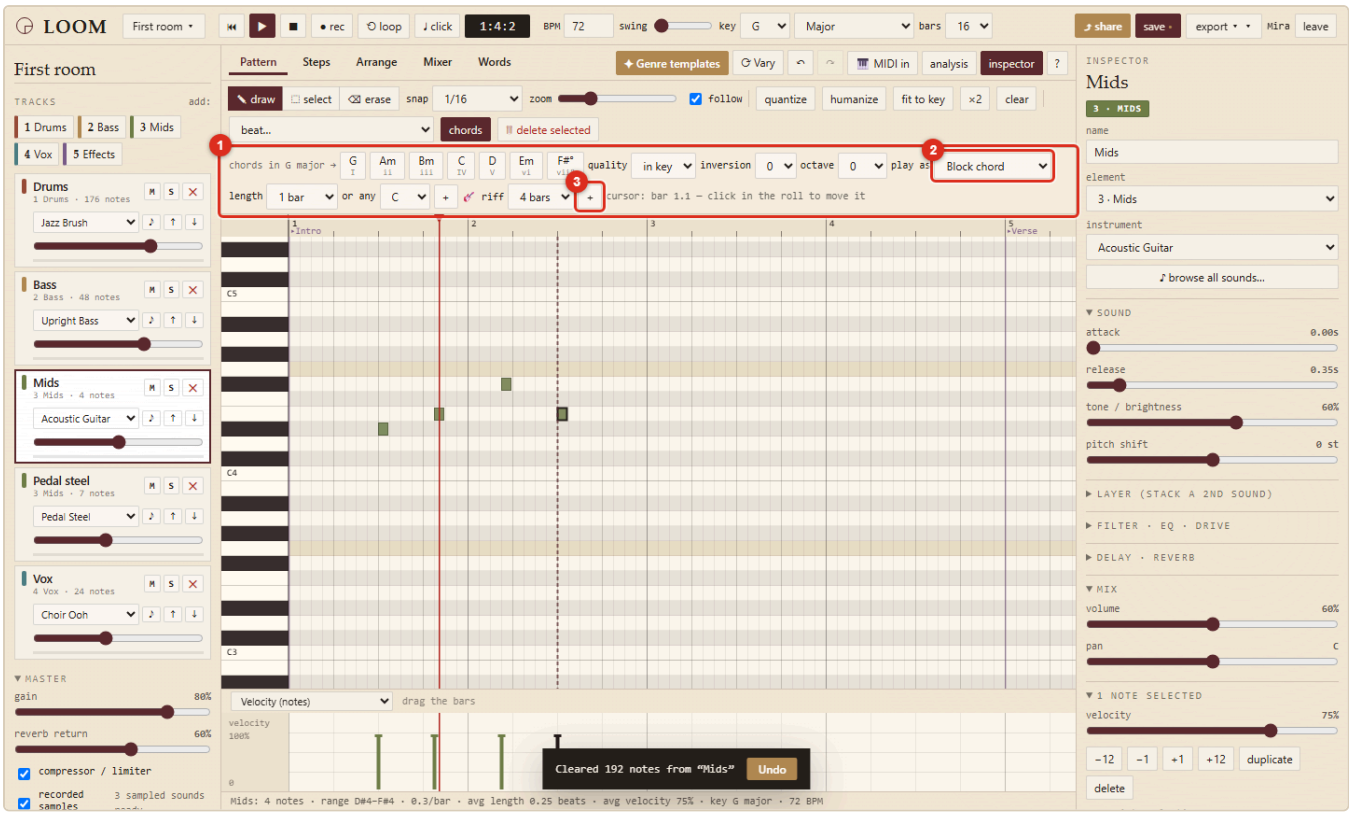

2 — Tool bar: **draw** is active.

Do this: With **draw** selected click an empty cell to add a note; drag its right edge to lengthen it; drag the body to move it; right-click to delete it.

You will see: Notes appear immediately and play on the next pass.

Tip: Hold `Shift` and click to select several notes.

Step 12 · The chord palette

1 — The seven chords of your key, with Roman numerals.

2 — **play as**: block chord, folk strum, fingerpicking, power chords …

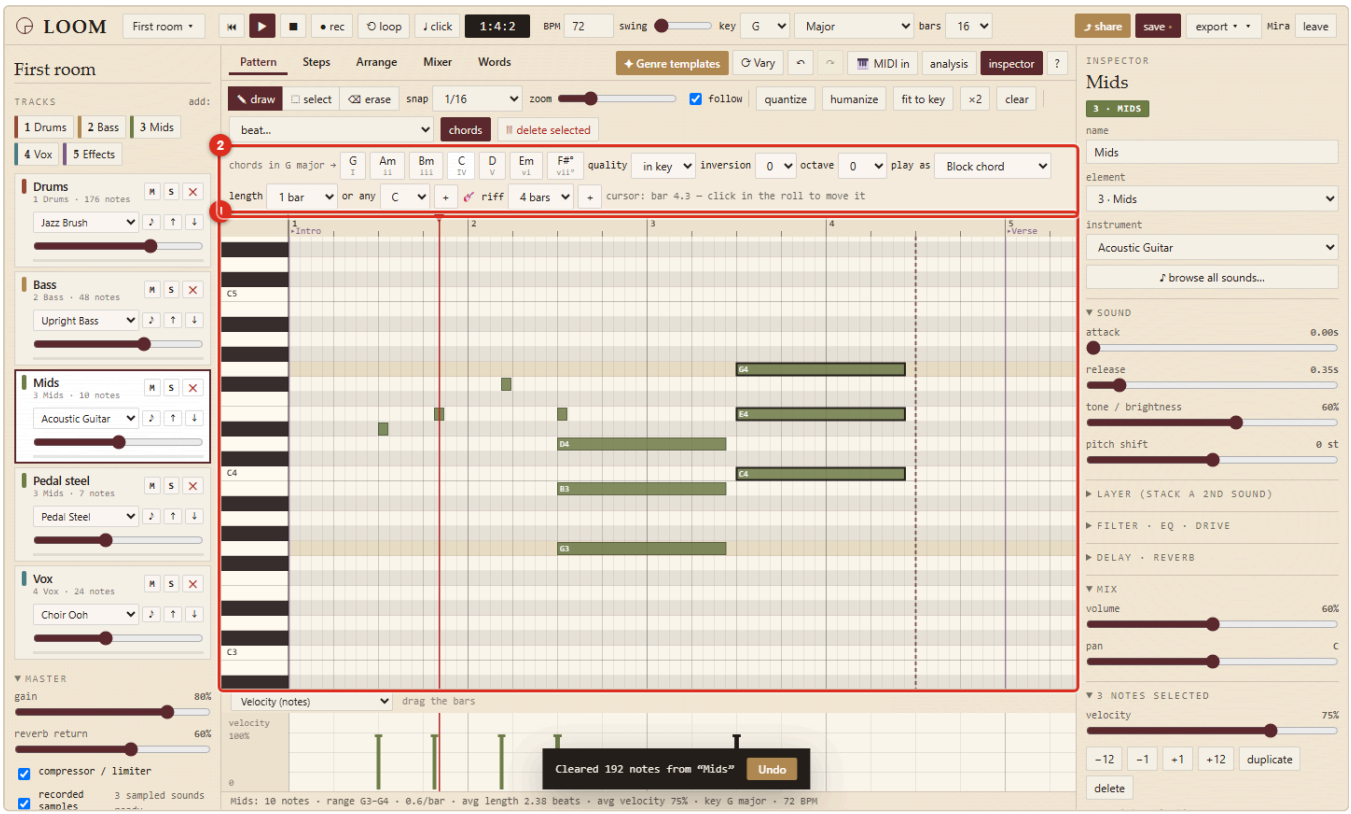

3 — **riff**: writes a 2/4/8-bar guitar riff at the cursor.

Do this: Choose a **play as** style first (try “Boom-chick” or “Fingerpicking”) and a length.

You will see: Nothing is written until you click a chord.

Tip: quality, **inversion** and **octave** re-voice the chord.

Step 13 · Insert chords

1 — The roll: chords appear at the dashed cursor, which then moves on; click another spot to move it.

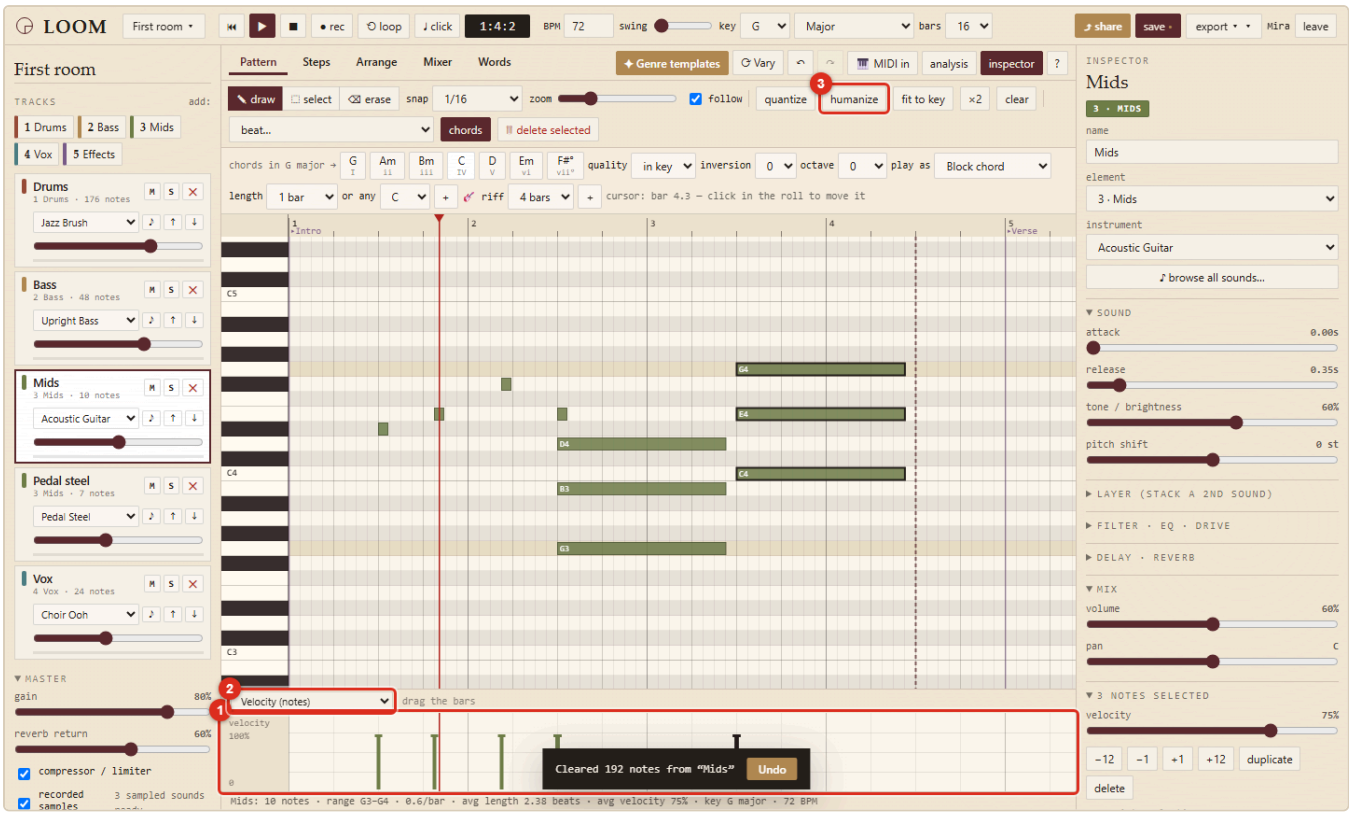

2 — The palette: click each chord to insert it.

Do this: Click **G**, then **C**, then **D**. They chain one after another.

You will see: Full chords with the chosen strum pattern.

Tip: On a Bass track only the root is written — a quick way to follow your chords.

Step 14 · Shape the loudness (velocity)

1 — Velocity bars: one per note; drag up/down to change loudness.

2 — The lane menu: velocity or automation.

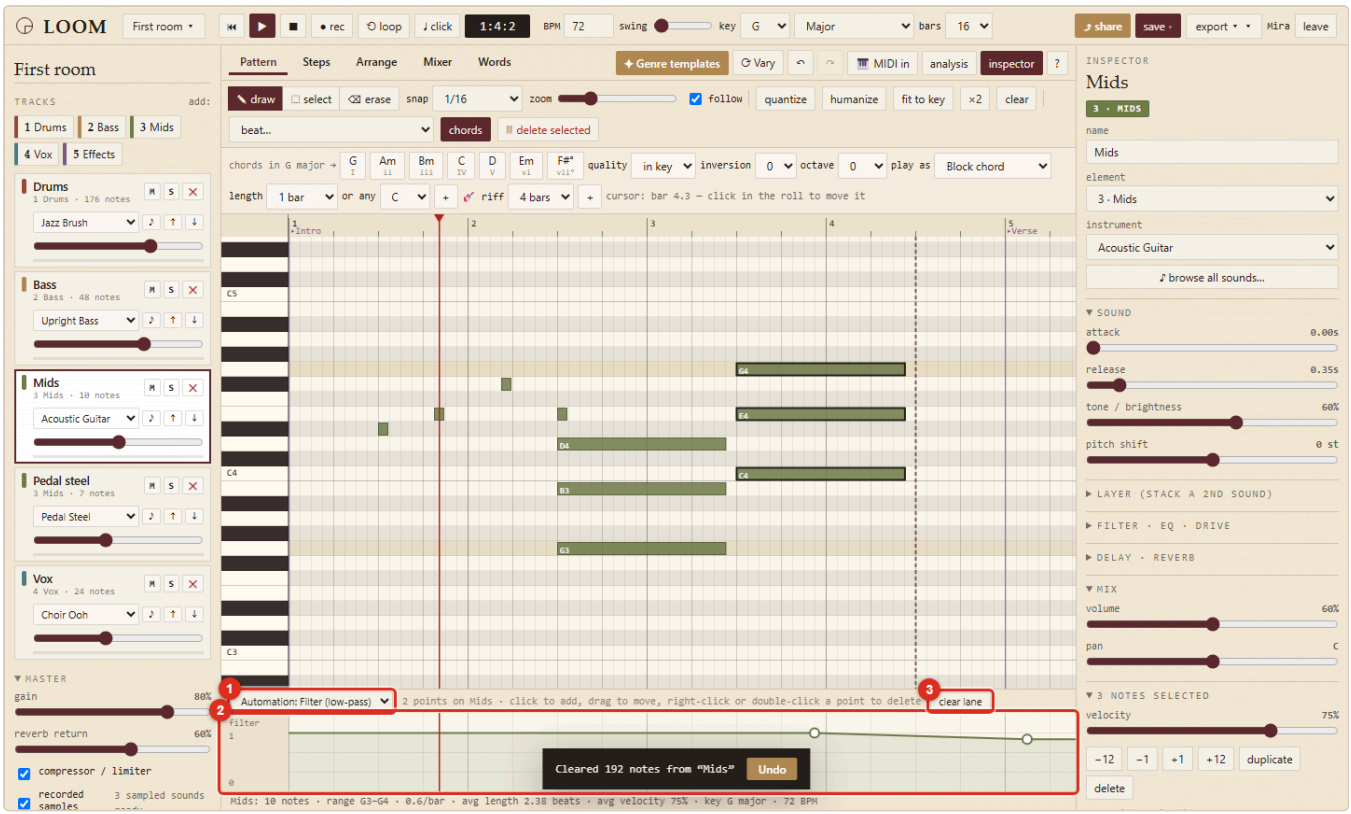

3 — **humanize**: adds small random timing and velocity changes.

Do this: Drag across the bars to paint a rhythm of loud and soft notes. Select notes first to change only those.

You will see: Accented notes pop, soft notes sit behind.

Tip: Use **humanize** on stiff, machine-like parts.

Step 15 · Automate a filter

1 — Change the lane menu to **Automation: Filter**.

2 — Click to add points; drag to move; double-click to delete.

3 — **clear lane** removes it.

Do this: Draw a curve that starts low and rises. Play the song.

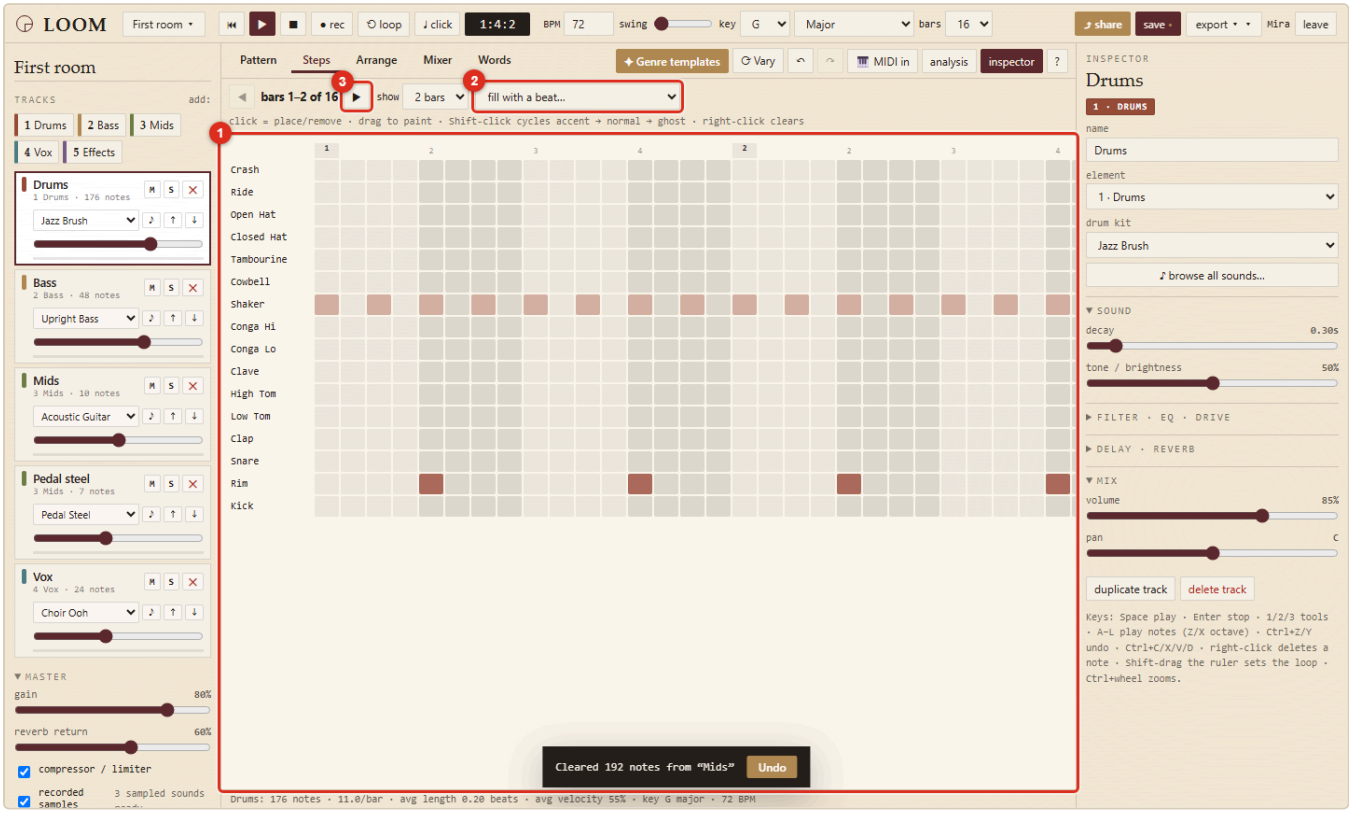

You will see: The sound opens up over time. The same works for volume, pan, reverb and delay.

Tip: The dashed line shows the knob's own value when a lane is empty.

Part C · Drums, arrangement and mixing

Program a beat on the step grid, structure the song, and balance the sounds.

Step 16 · Program drums on the step grid

1 — Each square is a sixteenth note; click to place or remove a hit.

2 — **fill with a beat...**: 44 ready-made beats.

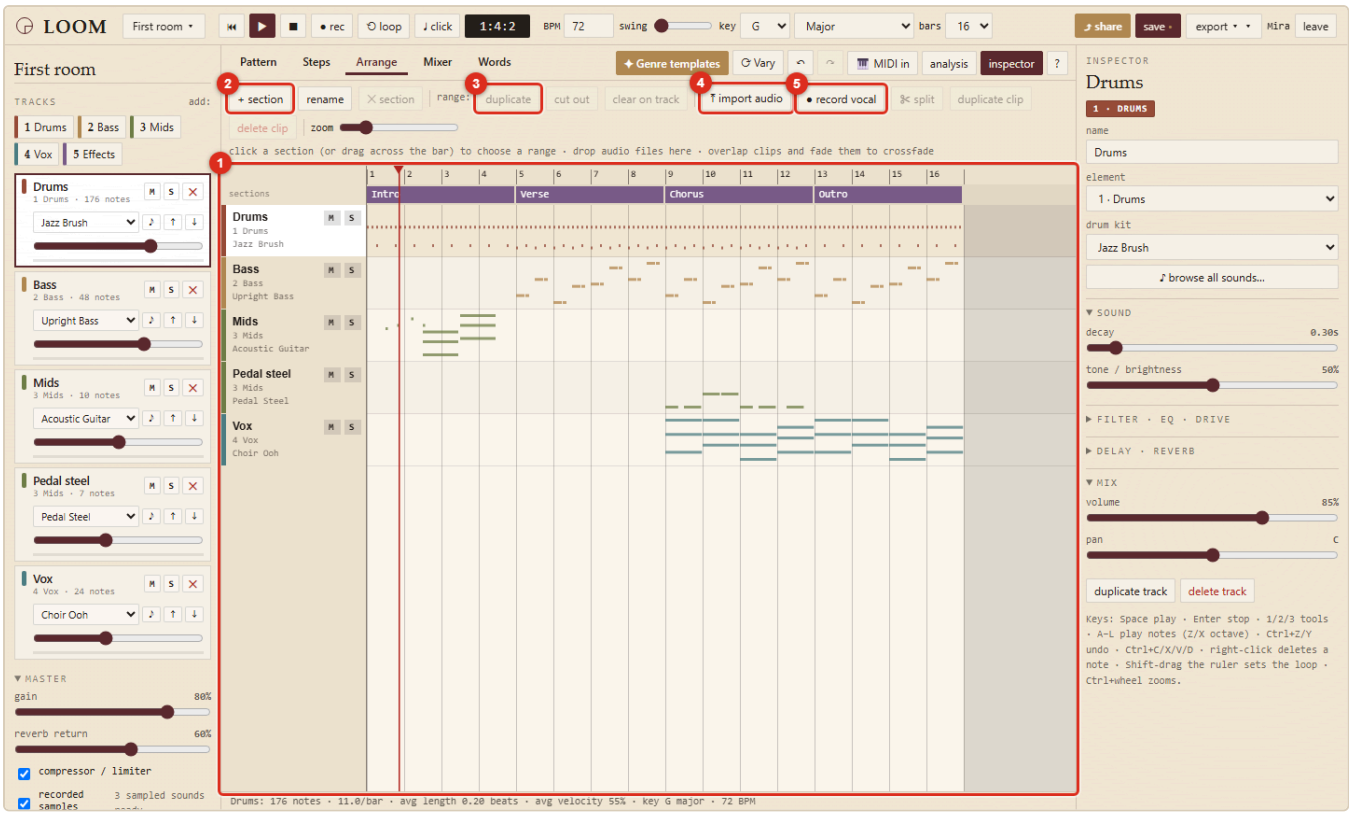

3 — Move through bars with the page arrows.

Do this: Select a Drums track, open **Steps**. Drag across squares to paint hits; `Shift`-click to cycle accent / normal / ghost.

You will see: Hits sound the moment you place them, and the loop plays them back.

Tip: Pick a beat from the menu, then edit it.

Step 17 · Structure the song in Arrange

1 — All tracks on one timeline; sections in the purple bar.

2 — **+ section** adds a named section.

3 — **duplicate** copies the selected range after itself.

4 — **import audio** adds a clip.

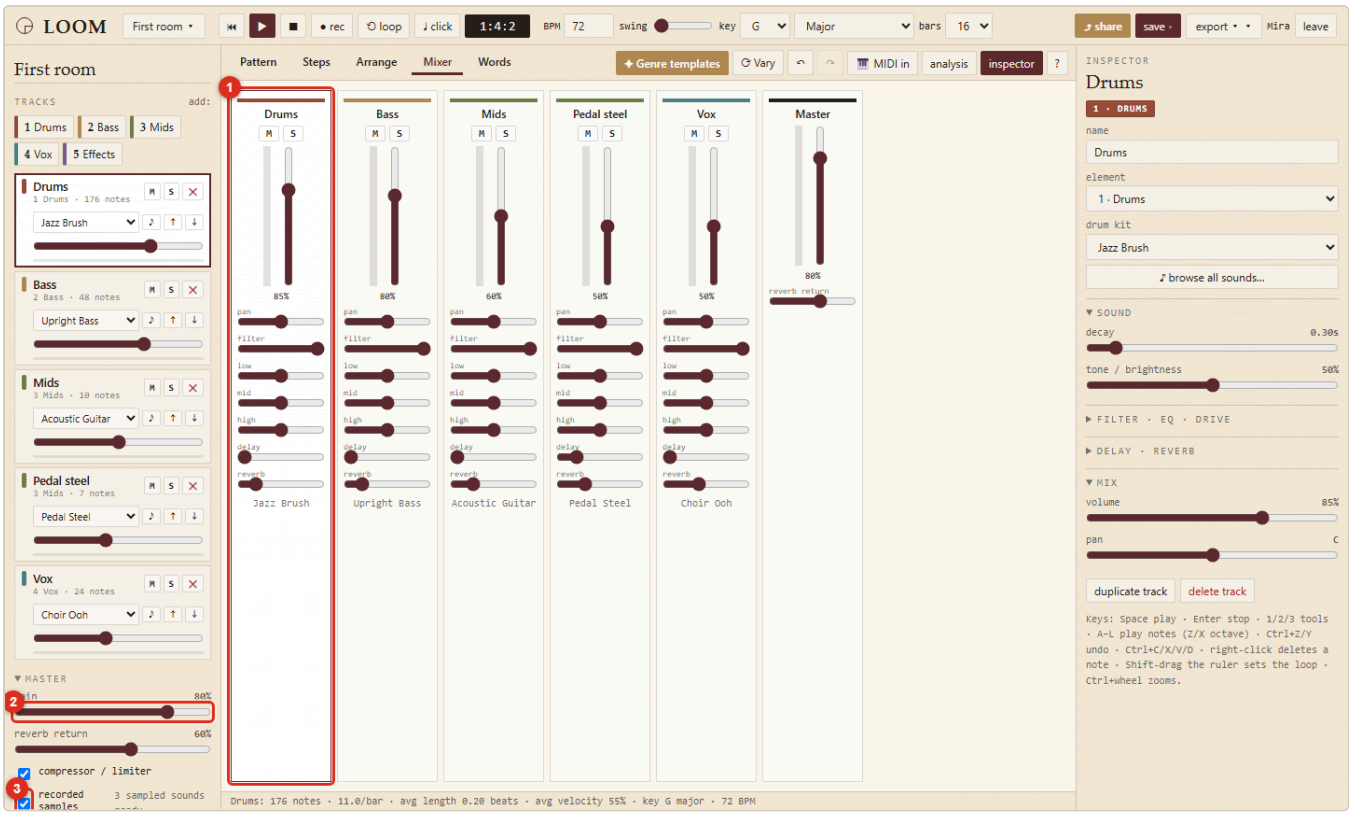

5 — **record vocal**.

Do this: Click a section to select it, then press **duplicate** to repeat a verse, or **cut out** to remove it. **clear on track** mutes a range on one track only (a breakdown).

You will see: The whole song is rearranged while the section markers stay in step.

Tip: Drop a WAV/MP3 straight onto a lane to import it.

Step 18 · Balance the mix

1 — The selected strip: fader, pan, filter, EQ, delay and reverb sends.

2 — Master gain.

3 — **recorded samples**: switch between recordings and the original synth sound.

Do this: Open **Mixer**. Set drums and bass first, add chords, then vocals; use EQ to clear space; use reverb sparingly on parts that should sit up front.

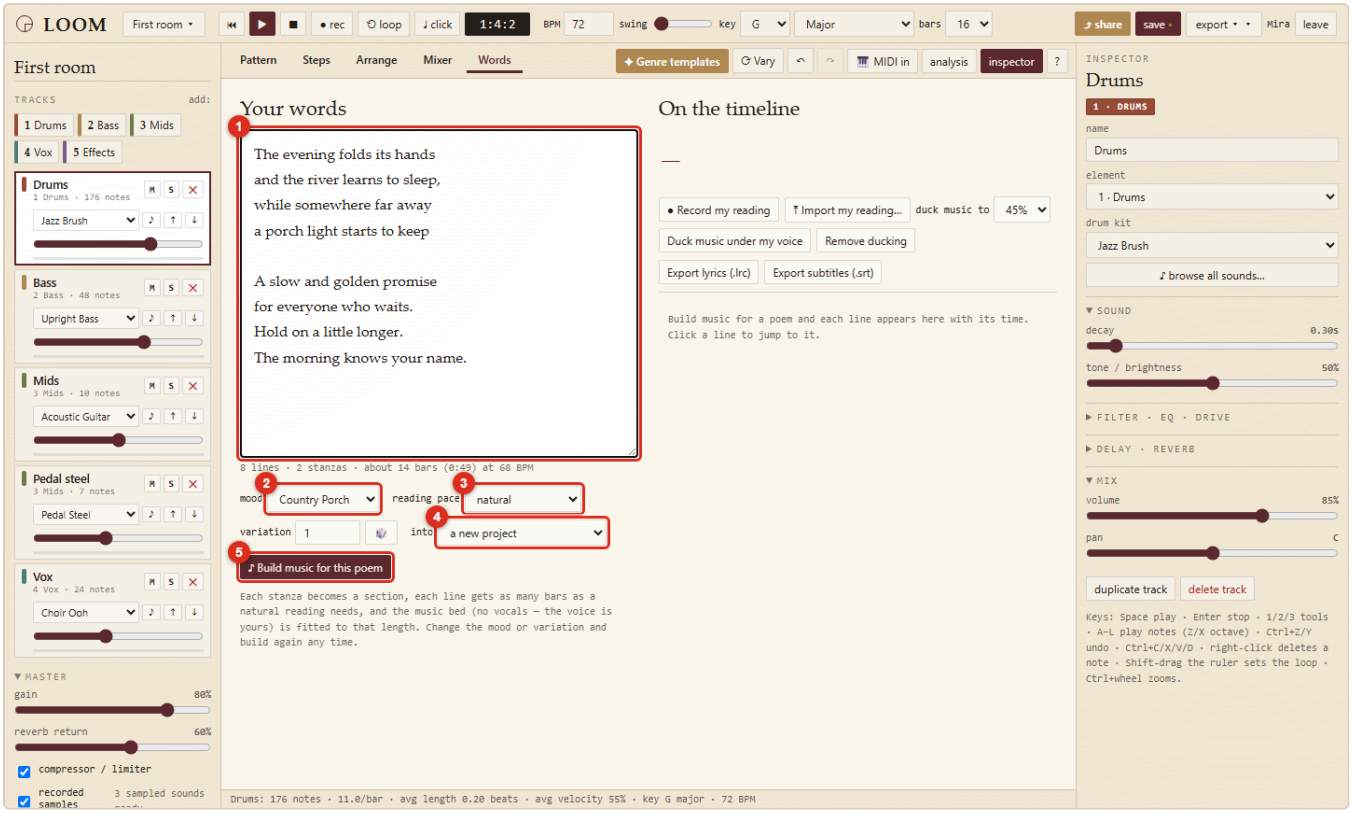

You will see: Meters move live while you play.

Tip: M mutes and S solos a track.

Part D · Turning a poem into music

Paste a poem, build a music bed, read over it and let the music duck under your voice.

Step 19 · Paste the poem and choose a mood

1 — Poem text — blank line between stanzas.

2 — Mood: soft acoustic, country porch, retro tape, jazz …

3 — Reading pace: slow, natural or brisk.

4 — Build into a new project or replace.

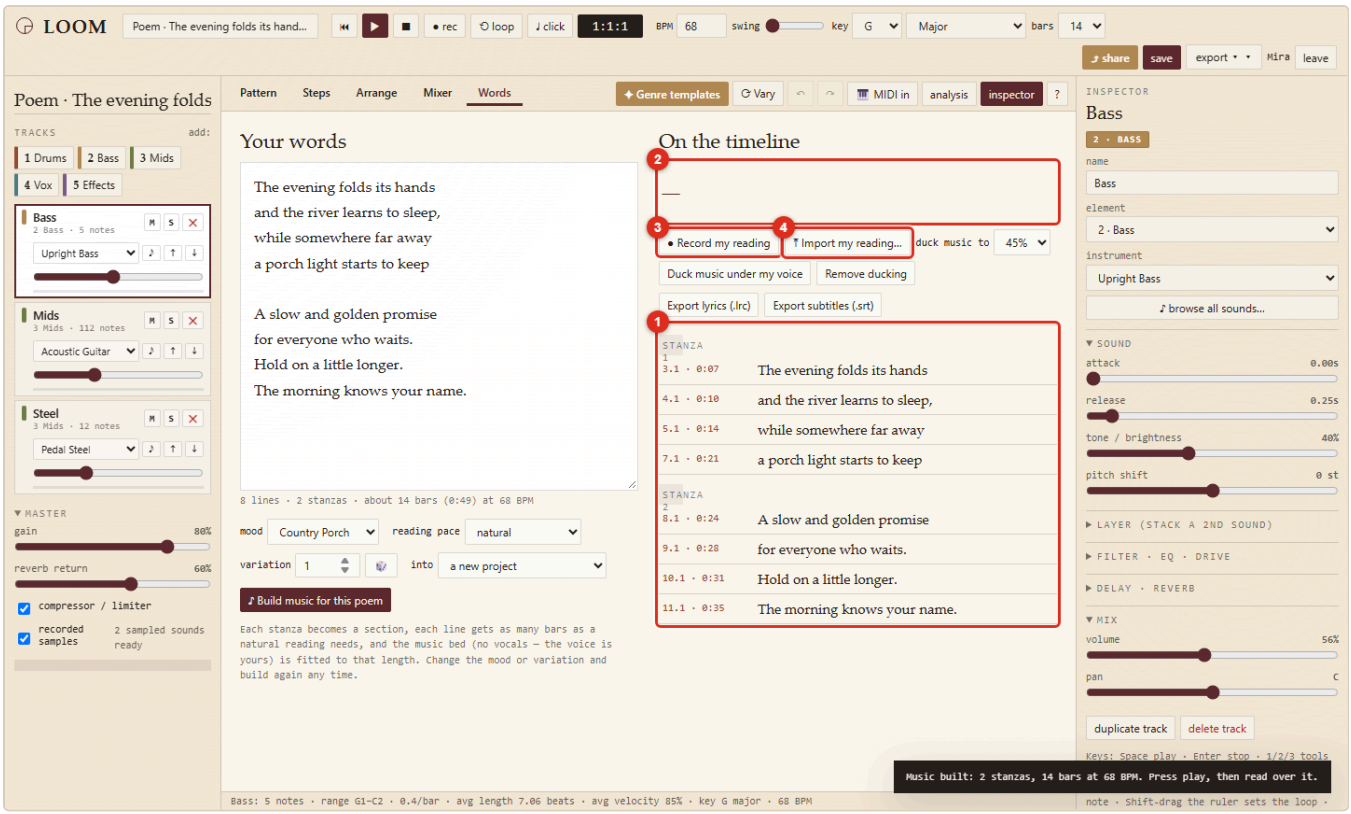

5 — **Build music for this poem**.

Do this: Open **Words**, paste your poem and choose the options.

You will see: The status line shows lines, stanzas and the estimated length.

Tip: Too fast? Rebuild with “slow & dramatic”.

Step 20 · Read what was built

1 — Every line has a time; click a line to jump to it.

2 — The current line in large text.

3 — **Record my reading** (microphone).

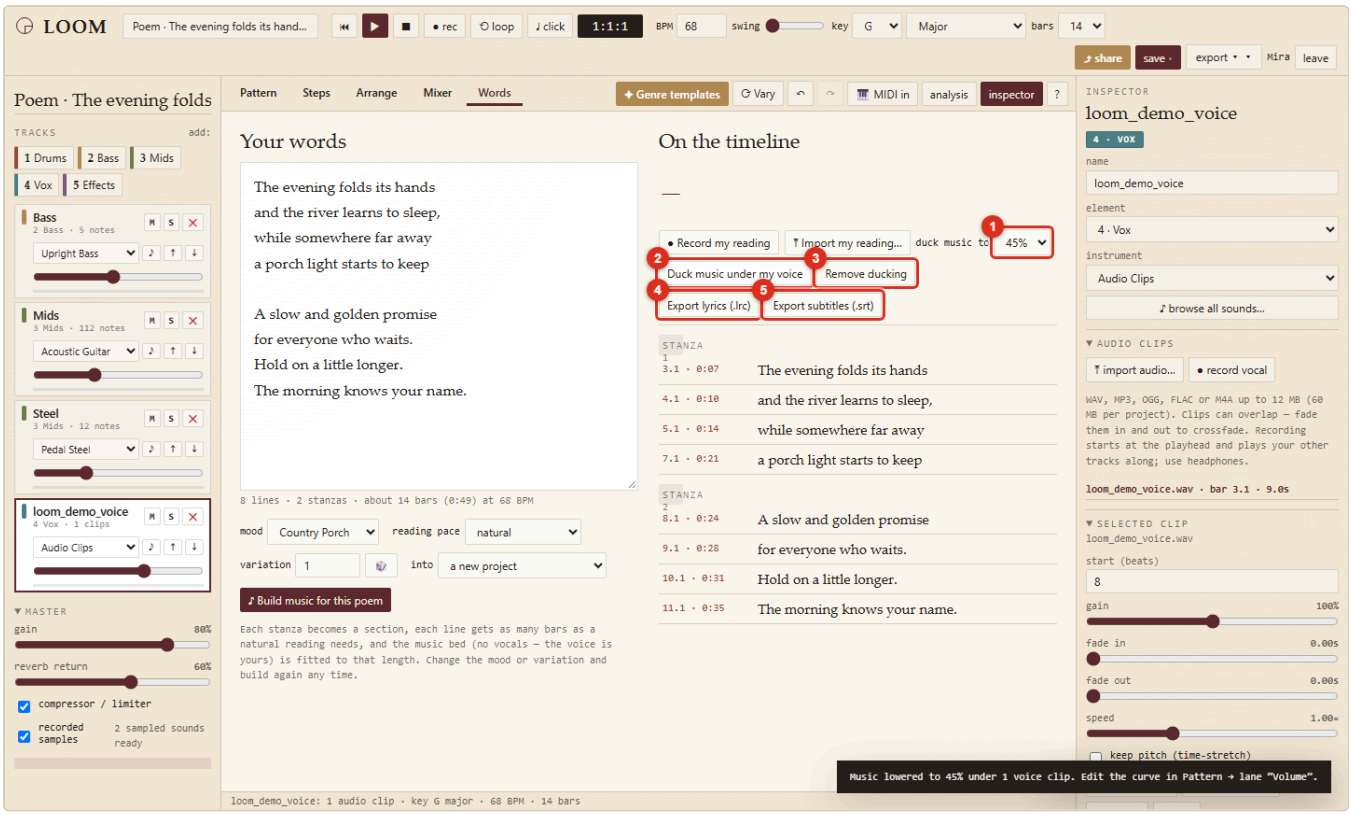

4 — **Import my reading** (existing recording).

Do this: Press play. The music bed has an intro, a section for each stanza and an outro, with no vocal part.

You will see: The lines highlight in time with the music.

Tip: Use headphones when recording.

Step 21 · Duck the music under your voice

1 — Ducking depth: how far the music dips.

2 — **Duck music under my voice**.

3 — **Remove ducking**.

4 — Export lyrics .lrc

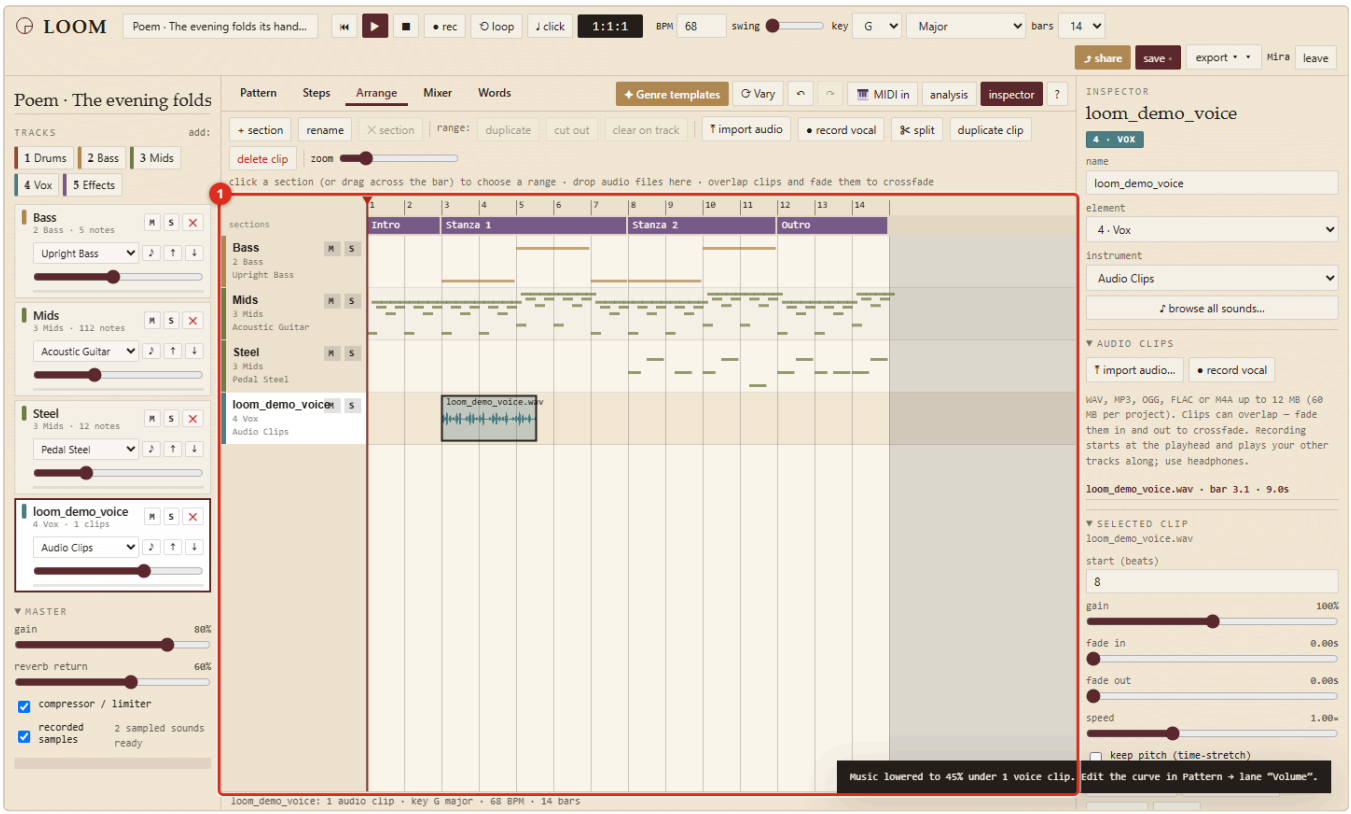

5 — Export subtitles .srt

Do this: After your voice clip is in place press the duck button.

You will see: Each music track gets a smooth dip just before you speak and a return afterwards (shown as volume automation).

Tip: Moved the clip? Press duck again.

Step 22 · Check the arrangement

1 — Voice clip (waveform) sits at the first line; sections follow the stanzas.

Do this: Open **Arrange**. Drag the clip to line it up, add fade in/out in the inspector.

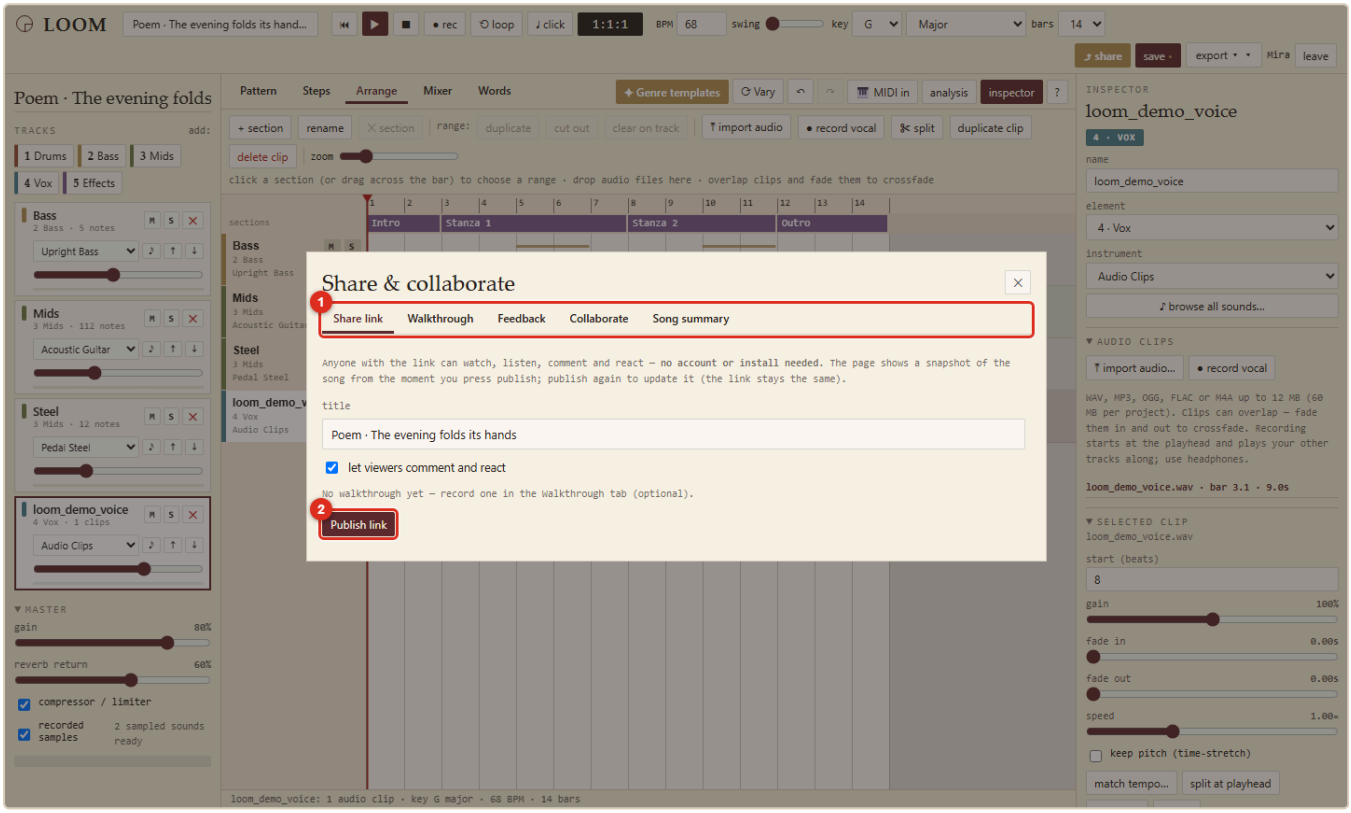

You will see: The recording and the music bed line up.

Tip: Overlap clips and fade them to crossfade takes.

Part E · Share, save and export

Send a link, save your work, and export audio.

Step 23 · Open the share dialog

1 — Tabs: link, walkthrough, feedback, team, summary.

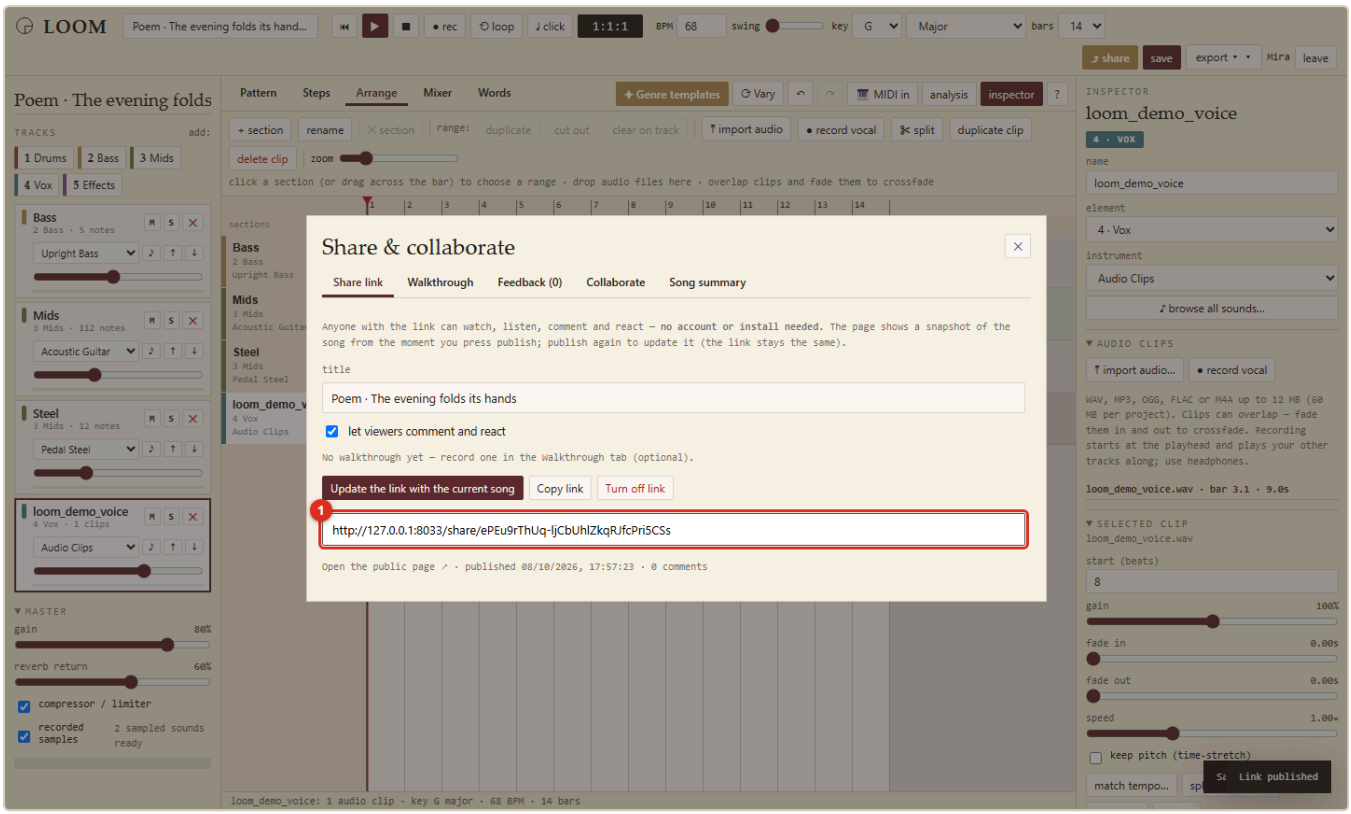

2 — **Publish link**.

Do this: Click ♪ **share**, then **Publish link**.

You will see: LOOM takes a snapshot of your song and creates a link.

Tip: Edits stay private until you update the link.

Step 24 · Copy the link

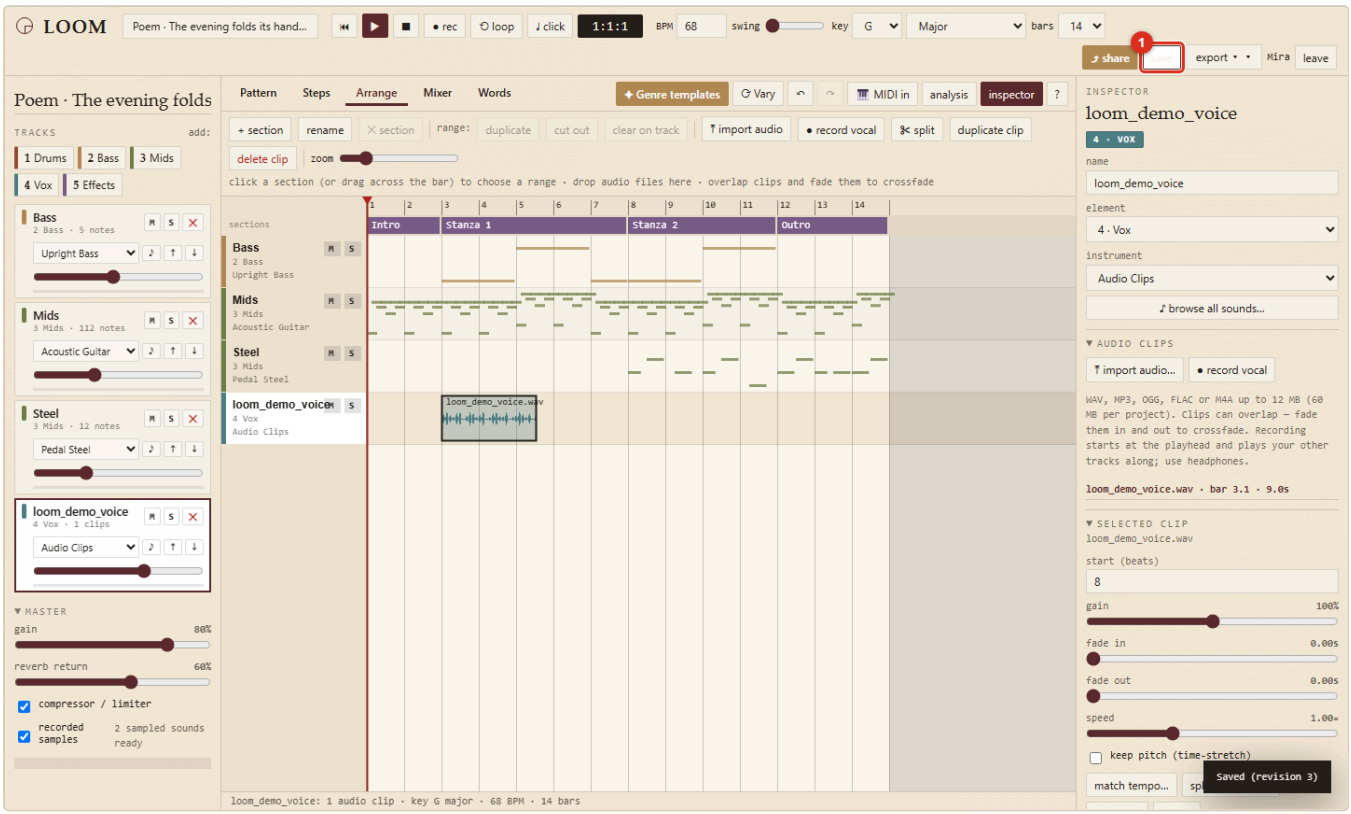

1 — The public link — anyone can open it without an account.

Do this: Copy and send it. Viewers can play the song, read lyrics, comment on an exact second and react.

You will see: You see their comments in the Feedback tab.

Tip: Turn off link deletes the page and its comments.

Step 25 · Save

1 — **save** (`Ctrl` + `S`).

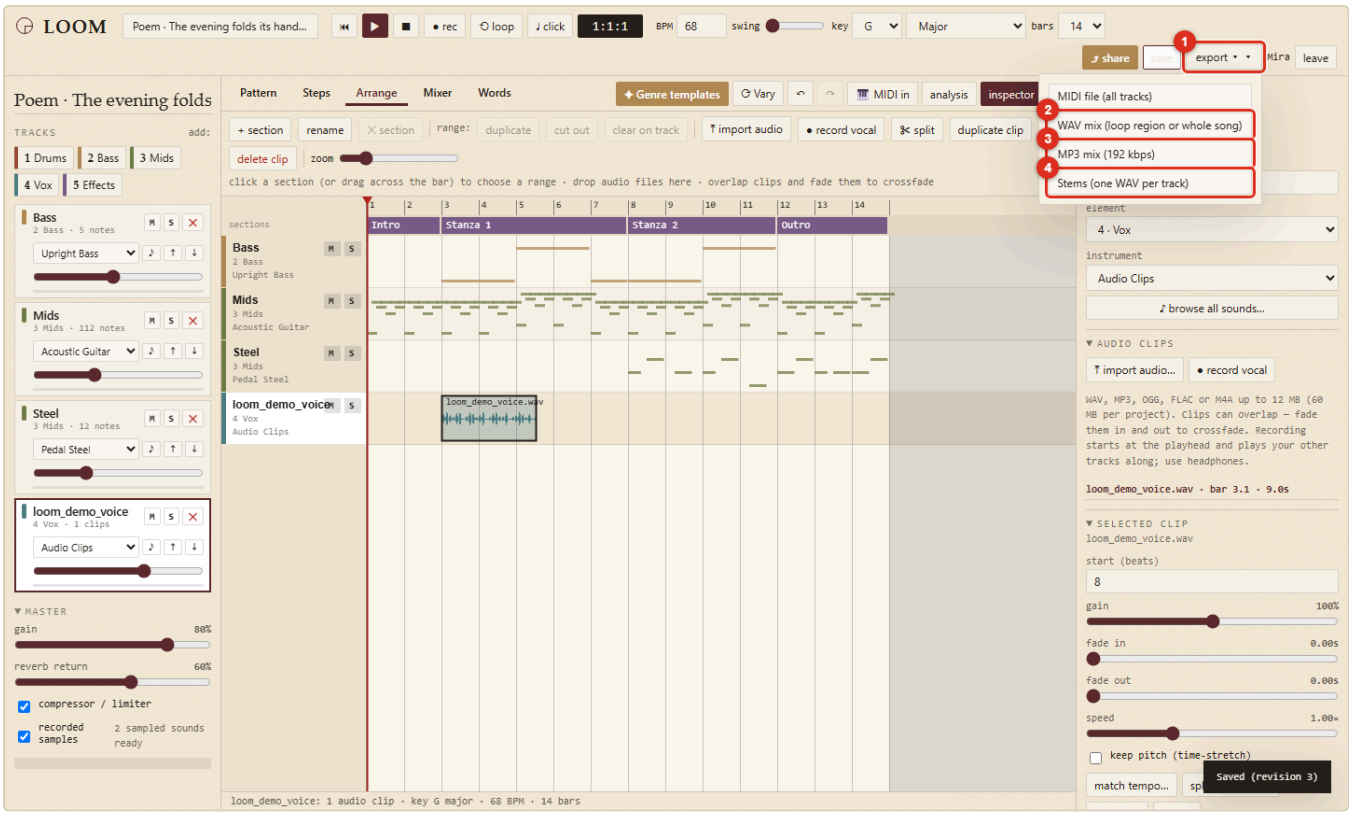

2 — The dot means unsaved changes.

Do this: Save regularly. Each save is a version you can restore from *project* ▾ › *Version history*.

You will see: A “Saved (revision N)” message confirms it.

Tip: Collaborators: if someone saved first you get a merge dialog.

Step 26 · Export

1 — **export** menu.

2 — **WAV mix** (16-bit, 44.1 kHz).

3 — **MP3 mix** (192 kbps).

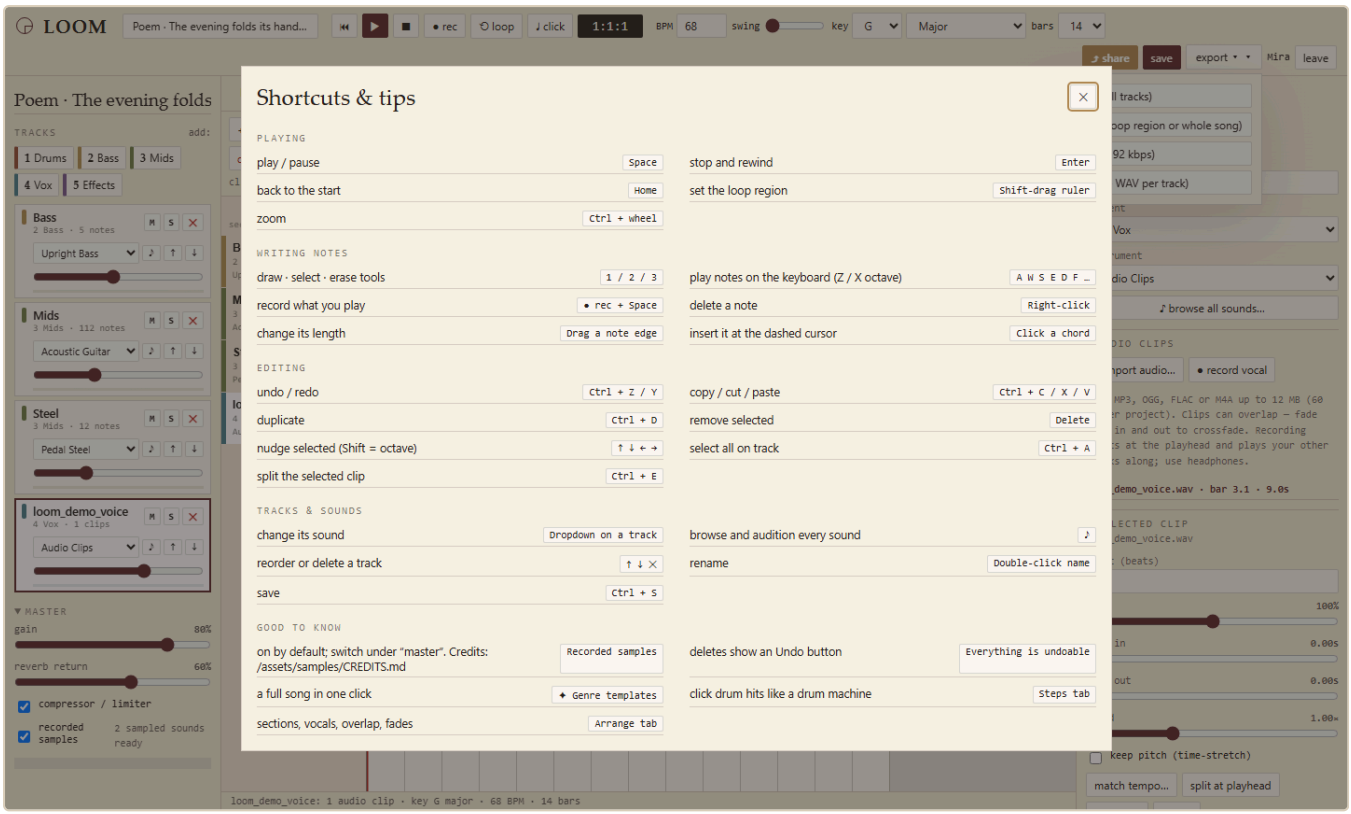

4 — **Stems**: one WAV per track.

Do this: Pick a format. Turn on loop first to export only the loop region.

You will see: The file downloads when rendering finishes (tens of seconds for big songs).

Tip: MIDI export keeps notes and section names but not audio clips.

Step 27 · Keep the shortcut sheet handy

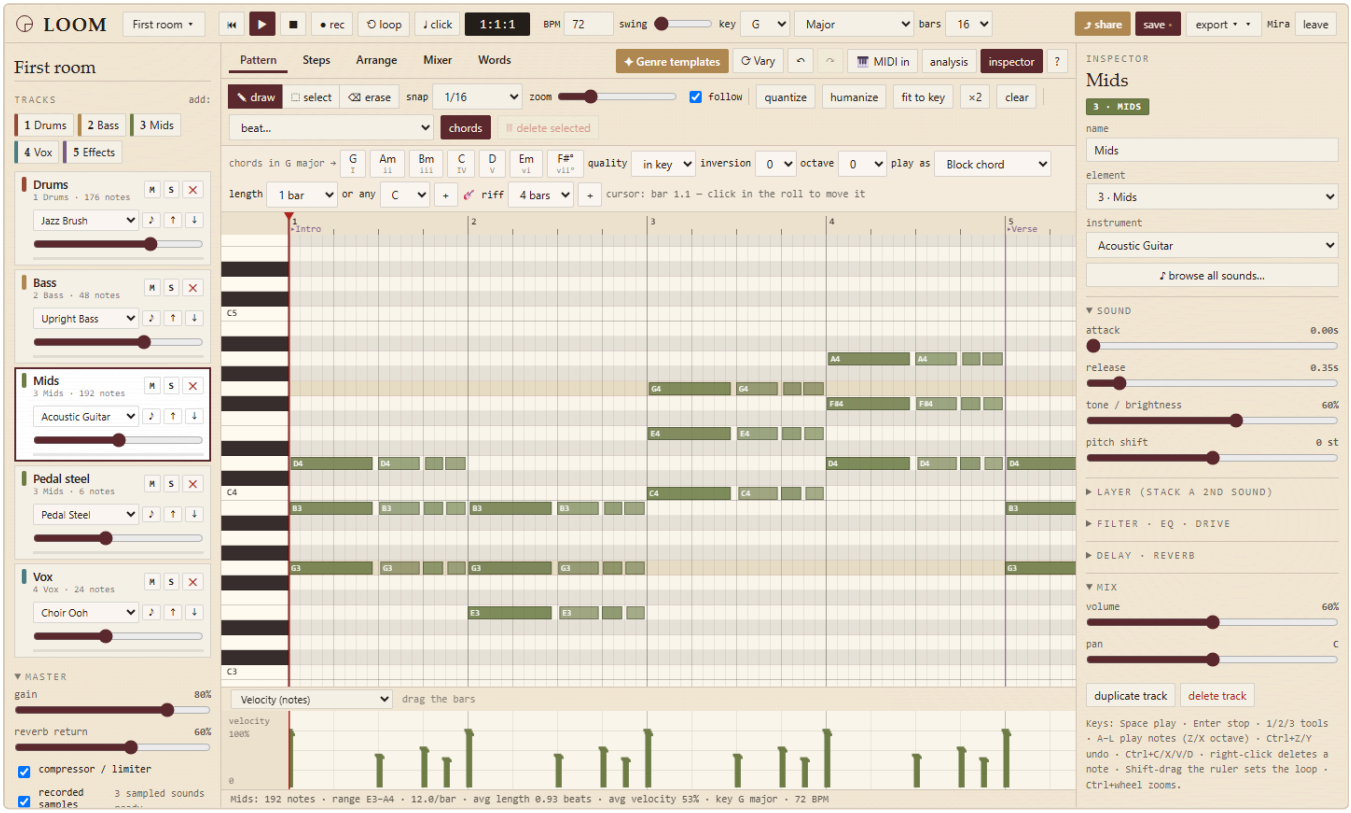

Do this: Press ? any time.

You will see: A sheet lists every shortcut for playing, writing and editing.

Tip: The full list is in chapter 17.

3 · The screen at a glance

The studio. Left: project name, tracks and master. Centre: the view tabs and the editing area. Right: the inspector for the selected track.

Top bar

Control	What it does
project ▾	The project menu: switch project, create a blank room (one empty track per element), create from a genre template, import a MIDI file, open the version history, delete the project (owner only).
⏮ ▶ ■	Return to start (`Home`), play / pause (`Space`), stop and rewind (`Enter`).
● **rec**	Arms note recording: while the song plays, keys on your computer keyboard or a MIDI keyboard are written into the selected track.
↻ **loop**	Loops the region between the loop markers. Set the region by `Shift`-dragging on a ruler.
♩ **click**	Metronome (accented on the first beat of each bar). Heard live only; never exported.
time display	Position as bar : beat : sixteenth. Hover for minutes:seconds.
BPM	Tempo, 30–240. Changing it re-times everything, including the delay effect.
swing	0–100%. Delays every off-beat eighth note a little for a looser, shuffled feel.
key, scale	Root note and scale (Chromatic, Major, Minor, Dorian, Mixolydian, Pentatonic Major/Minor, Blues). Highlights in-key rows in the piano roll, builds the chord palette and powers *fit to key*.

bars	Song length: even numbers up to 32, then multiples of 4 up to 64.
⤴ share	Opens the share dialog: public link, walkthrough recorder, feedback, collaborators, song summary (chapter 16).
save	Saves the project (`Ctrl`+`S`). If a collaborator saved first you are asked how to merge.
export ▾	MIDI file, WAV mix, MP3 mix, or one WAV per track (stems). See chapter 15.

Left panel

- **Project name** — click to rename.
- **add: 1 Drums … 5 Effects** — adds an empty track of that element.
- **Track cards** — each shows name, element, note count, a level meter and: *M* mute, *S* solo, ✕ delete, a **sound dropdown**, ♪ sound browser, ↑ ↓ reorder, and a volume slider. Double-click the name to rename. Click anywhere else on the card to select the track.
- **master** — output gain, reverb return, compressor/limiter, and the *recorded samples* switch (chapter 10).

Tabs

Pattern (notes), **Steps** (drum grid), **Arrange** (song timeline and audio clips), **Mixer**, **Words** (poems). On the right of the tab bar: ✦ **Genre templates**, ⟳ **Vary**, undo/redo, 🎹 **MIDI in**, **analysis** (charts and a live scope), **inspector** (show/hide), and **?** (shortcut sheet).

4 · The five elements

LOOM organises every song around five parts. A good track usually has at least one of each, and the colour chips on the left panel add them. This is the "5-element formula".

1 Drums 2 Bass 3 Mids 4 Vox 5 Effects

Element	Role	Sounds
1 · Drums	Rhythm and energy. Edited per drum lane (kick, snare, hats…).	10 kits: Acoustic (real recorded drums), Rock, Jazz Brush, 808, Trap, Lo-Fi, Electronic, House, Linn (LinnDrum samples), CR-78 (Roland samples). 16 lanes: kick, rim, snare, clap, low/high tom, closed/open hat, crash, ride, tambourine, cowbell, congas, shaker, clave.
2 · Bass	The low foundation; locks to the kick and the chord roots.	Sub, Synth, Electric (sampled), Pluck, Acid 303, Reese, FM, Wobble, Slap (sampled), Upright (sampled), Square Sub.
3 · Mids	Chords, guitars, keys, melodies and leads — the harmony and the tune.	Keys & mallets (Soft Keys, Rhodes, Grand Piano, Organ, Clav, Vibraphone, Marimba, Kalimba, Music Box, Accordion), guitars (Acoustic, Electric Clean, Overdrive, Distortion, Muted, 12-String, Nylon, Ukulele, Banjo, Mandolin, Harp, Pedal Steel), strings & winds (Strings, Violin, Cello, Pizzicato, Mellotron, Trumpet, Sax, Flute, Brass Section), synths (Warm Pad, Analog Poly, Pluck, Saw/Square Lead, Super Saw).
4 · Vox	Voices: sung-style synth choirs, or your own recorded/imported audio.	Choir Ahh/Ooh/Eee, Vox Lead, Vox Chop, Whisper, Humming, and **Audio Clips** (a track that holds recordings and imported files).
5 · Effects	Transitions and atmosphere.	Riser, Downlifter, Impact, Noise Sweep, Laser, Texture, Reverse Cymbal, Sub Drop, Vinyl Crackle, Wind, Whoosh, Glitch.

77 instruments in all; 31 of them (plus three drum kits) play real recordings when *recorded samples* is on — chapter 10.

> **CHANGING ELEMENT** Picking a sound from another element (for example a guitar on a bass track) moves the track to that element automatically. The inspector's *element* dropdown does the same on purpose.

5 · Pattern view — the piano roll

Pattern is where notes are written. The grid runs left to right in time (a bar is four beats) and top to bottom in pitch; for drum tracks the rows are drum names instead of pitches. Faint shapes behind your notes are "ghost notes" from your other tracks, so you can see how parts overlap and line up.

The toolbar

Control	What it does
✎ **draw (1)**	Click an empty cell to add a note (length = last length you used, at least one snap step). Drag horizontally while creating to set its length. Clicking an existing note moves/resizes it instead.
⬚ **select (2)**	Click a note to select; `Shift`-click to add or remove; drag on empty space for a box. Drag selected notes to move them in time and pitch; drag the right edge to change length. Moves snap to the grid.
⌫ **erase (3)**	Click or drag across notes to delete them. (Right-click deletes a single note in any tool.)
snap	Grid resolution: 1 bar, 1/2 bar, beat, 1/8, 1/8 triplet, 1/16, 1/16 triplet, 1/32.
zoom, follow	Horizontal zoom (also `Ctrl`+wheel). *Follow* scrolls the roll with the playhead.
quantize	Snaps the selected notes (or all notes if none selected) to the grid, including their lengths.
humanize	Nudges timing by up to about ±0.025 beat and velocity by up to about ±8% so a mechanical part breathes.
fit to key	Moves out-of-key notes to the nearest note of the chosen key and scale.
×2	Repeats the track's pattern once more straight after its end (rounded up to whole bars) and grows the song if needed.
clear	Deletes every note on this track (with an Undo button).
beat…	For drum tracks: fills the whole song with a chosen beat (44 to choose from, grouped by family, with the usual tempo range shown). Fills appear on every fourth bar and crashes on bar one of each group of four.
chords	Shows or hides the chord palette.
🗑 **delete selected**	Removes the selected notes (also `Delete`). Shows an Undo button.

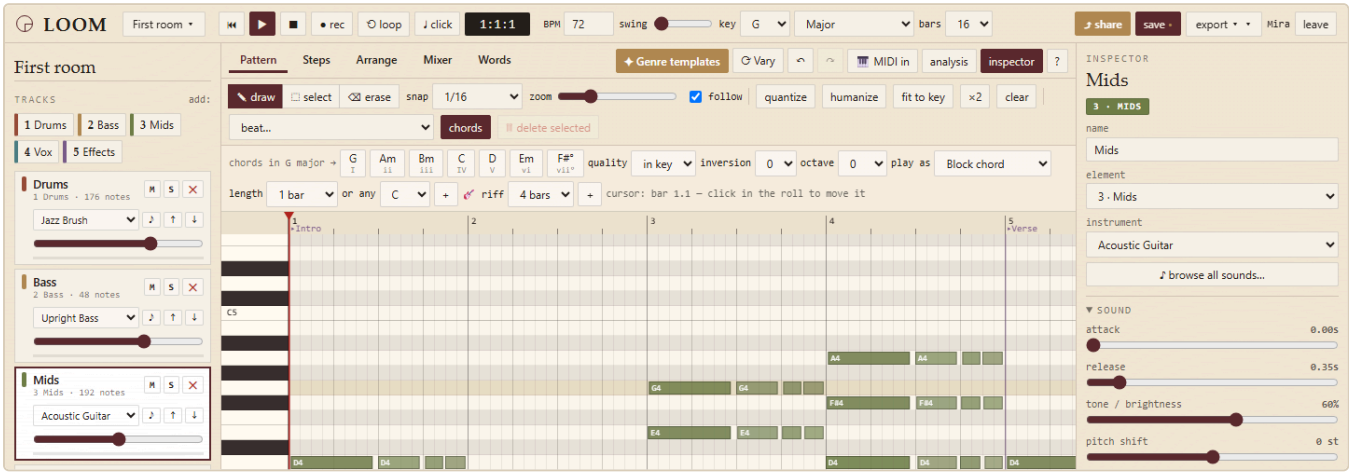

The ruler, cursor and keys

- **Ruler** — click to move the playhead; `Shift`-drag to set the loop region. Section names from Arrange appear here.
- **Dashed insert cursor** — where the next chord or riff from the palette will be written. Click in the roll to move it; it advances after each insertion so chords chain.
- **Piano keys / drum names** — click to hear that pitch or drum with the track's sound.
- **Velocity lane** — below the roll: one bar per note; drag to set loudness (notes under the pointer, or the whole selection). Switch this lane to an automation lane — see chapter 13.

Selection actions (inspector)

With notes selected the inspector shows: a velocity slider; transpose buttons (−12, −1, +1, +12 semitones); duplicate; delete; and **arpeggiate** (turns selected chord notes into an up, down, up-down or random pattern at 1/4, 1/8, 1/8T or 1/16).

The chord palette

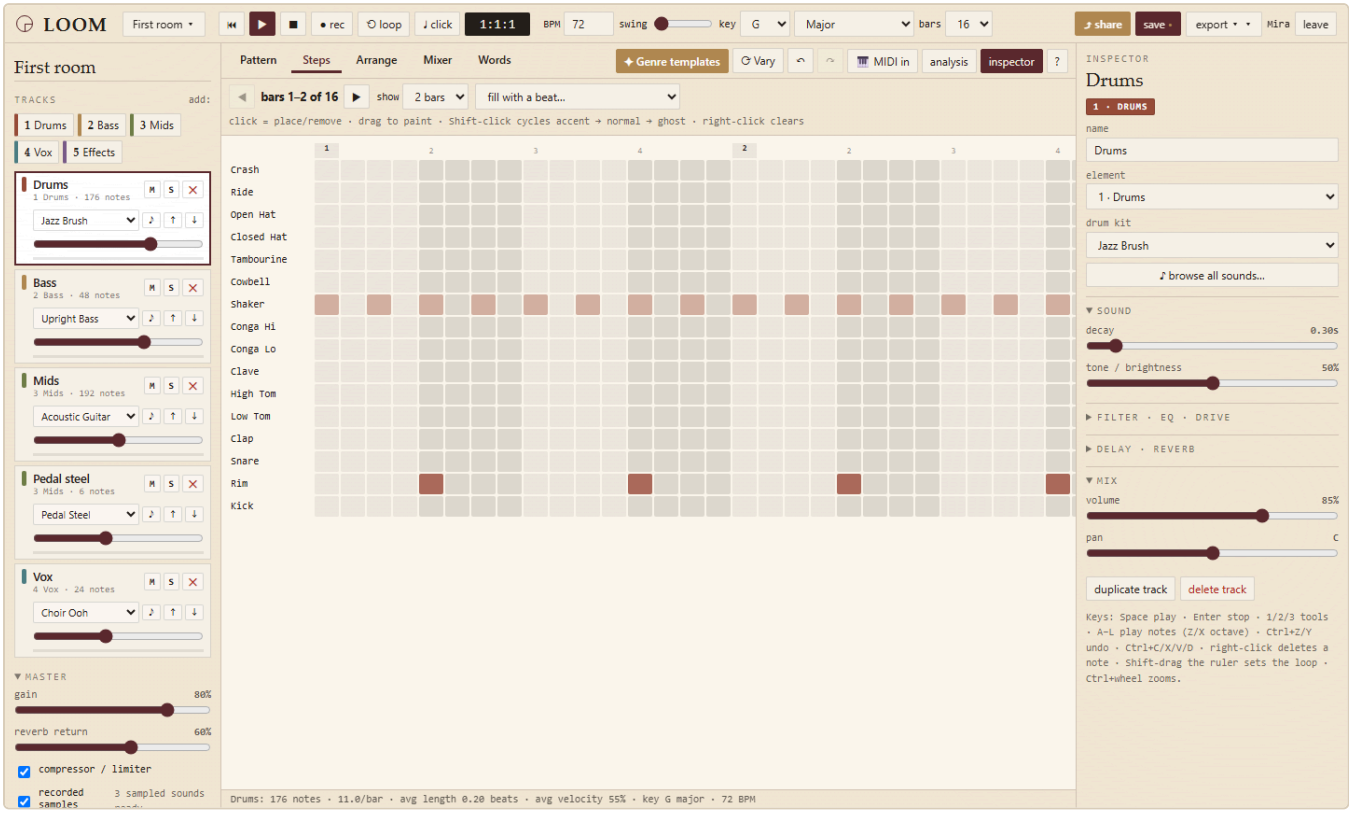

The strip under the toolbar: the seven chords of the current key, plus options.

Option	Meaning
chord buttons	The seven chords of your key and scale, with Roman numerals (I, ii, iii…). Click one to write it at the cursor.
quality	Override the quality (maj, min, 7, maj7, min7, sus2, sus4, dim, aug, add9, 9, min9, 6, min6, dim7, m7b5) — "in key" uses the diatonic one.
inversion, octave	Re-voice the chord (root position, first or second inversion) and shift it down or up an octave.
play as	Block chord, folk strum, pop strum, ballad, down-strokes, boom-chick, funk scratch, **fingerpicking**, palm-mute **chug** or **power chords**. A strum spreads the notes slightly low-to-high (down) or high-to-low (up) like a real guitar.
length	1 bar, 2 beats, 1 beat, or the snap length.
or any + root	Insert any chord, not just the seven in-key ones.
🎸 **riff**	Writes a 2-, 4- or 8-bar pentatonic guitar riff in your key at the cursor: a short motif that repeats, with a changed ending every fourth bar.

> **TIP** On a Bass track the palette writes only the chord root, in the bass register — a quick way to follow your chords.

6 · Steps view — the drum machine

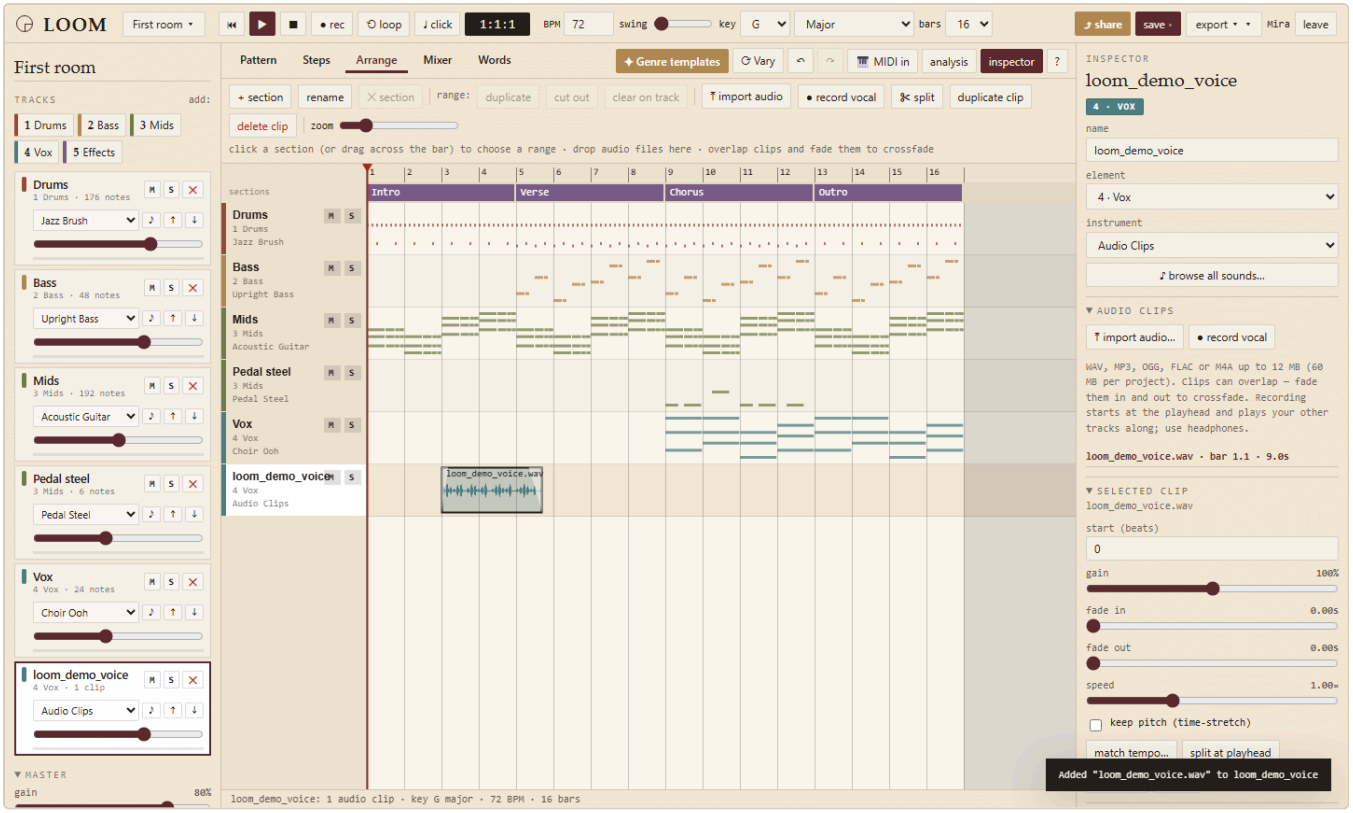

Steps: one row per drum, 16 steps per bar. A red outline follows the playhead.

Select a Drums track, then open **Steps**. Each square is a sixteenth note.

- **Click** an empty square to place a hit; click a filled square to remove it. **Drag** across squares to paint on or off.
- **Shift-click** to place an accent, or to cycle a hit between accent → normal → ghost (quiet).
- **Right-click** clears a square. Click a drum name on the left to hear it.
- **Page** arrows and *show 1/2/4 bars* move through long songs.
- The **fill with a beat…** menu writes a ready-made beat over the whole song.

Hits that are not on the sixteenth-note grid (for example recorded from a keyboard) do not appear here, but they still play and they show in Pattern.

7 · Arrange view — the song timeline

Arrange: sections along the top, one lane per track, note thumbnails, and an audio clip with its waveform.

Arrange shows the whole song at once. Every track is a lane; note tracks show a small picture of their notes, audio tracks show clips with waveforms.

Sections

- The purple bar under the ruler holds **sections** (Intro, Verse, Chorus…). Genre templates and poems create them for you; **+ section** adds one at the playhead (it asks for a name), **rename** renames the nearest one, **× section** deletes the selected one.
- **Click a section** to select it as a range (and jump to it). **Drag across the bar** to choose your own range, snapped to bars (hold `Alt` for fine control).

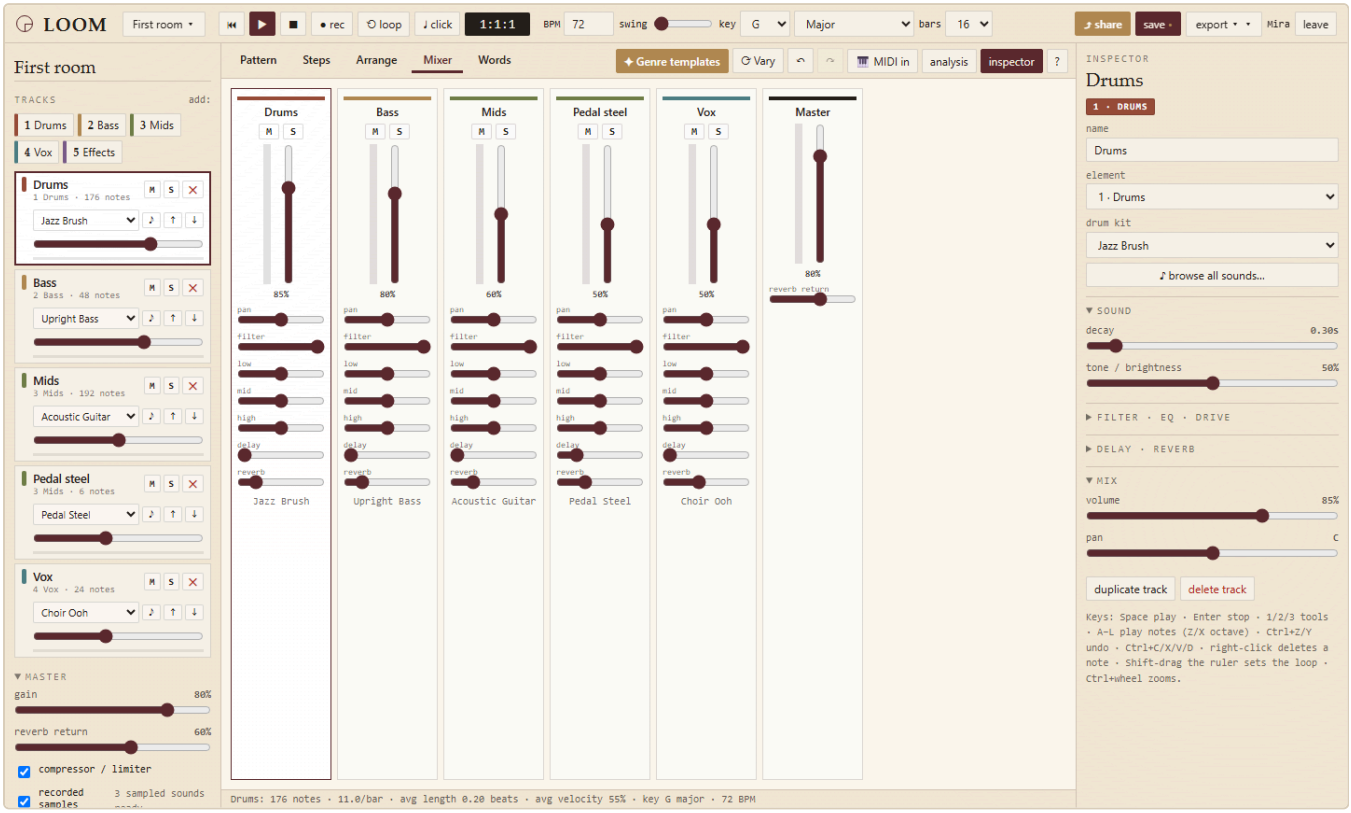

Range tools

Button	What it does (all tracks unless noted)
duplicate	Inserts a copy of the range right after it and pushes everything after it later. Section markers inside are copied too. This is how you turn a verse into two verses.
cut out	Removes the range and closes the gap.
clear on track	Empties the range on the *selected track only*, leaving the others playing — handy for a breakdown.

Audio clips

- **Import audio** or **drop files onto a lane**: WAV, MP3, OGG, FLAC, M4A or WebM up to 12 MB each. A new *Audio Clips* track is created if the selected track is not one.
- **Move** a clip by dragging it (also to another track); **trim** by dragging either edge; **split** at the playhead (`Ctrl` + `E`); **duplicate**; **delete**.
- **Overlap** — clips may overlap freely. Fade one out and the next in (inspector: fade in / fade out) to crossfade. Overlapping clips on different tracks simply layer.
- Click **M** / **S** in the lane header to mute or solo; click the lane to select the track.

8 · Mixer view

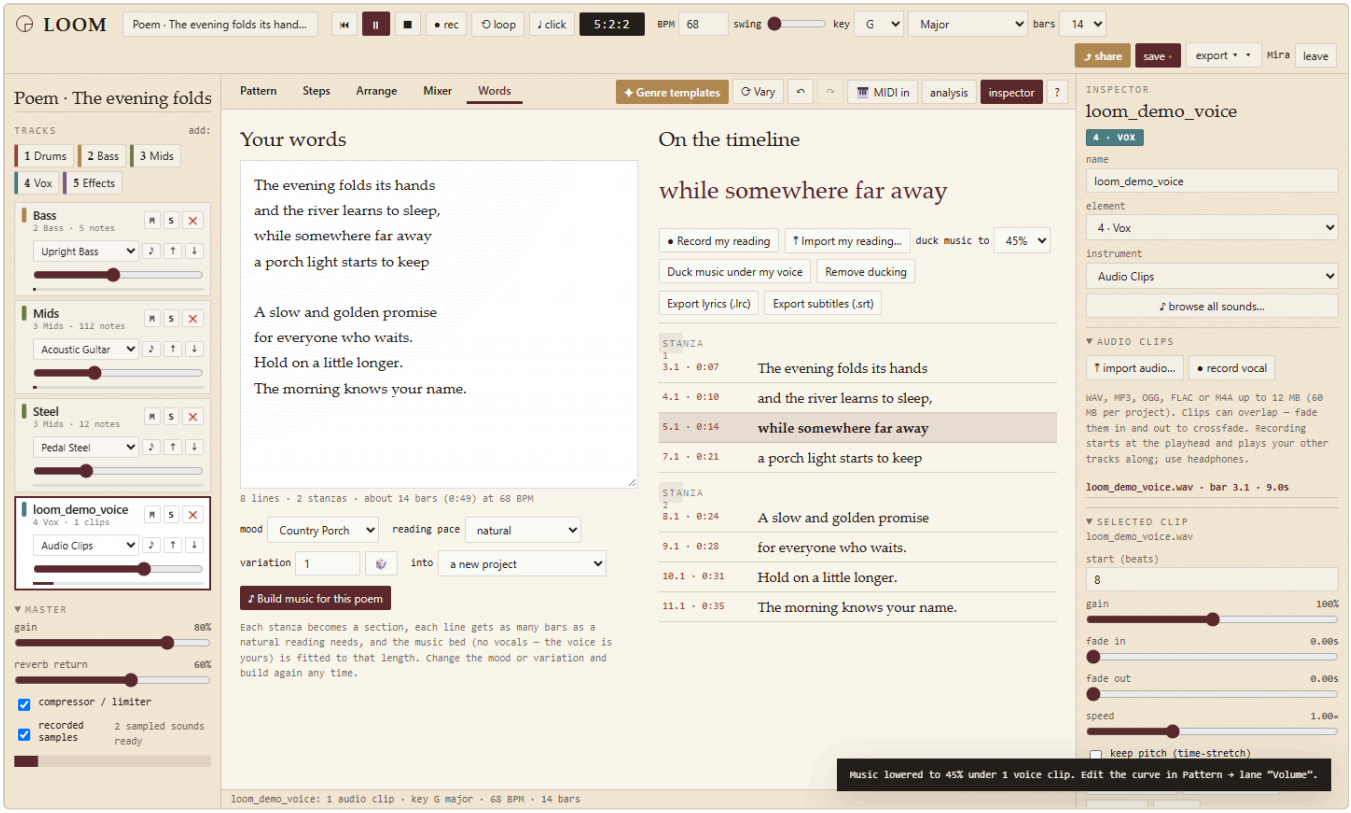

The mixer: one strip per track plus the master.

Strip control	Effect
fader + meter	Track volume (0–120%) with a live level meter that moves while the song plays.
pan	Left–right position.
filter	A low-pass filter: fully right = open, left = muffled. Great for "behind a wall" or for sweeps (automate it).
low / mid / high	Three-band EQ at 120 Hz (shelf), 1 kHz (bell) and 6 kHz (shelf), −12 to +12 dB.
delay	Send to a tempo-synced echo (a dotted eighth note, with soft repeats).
reverb	Send to a shared room-style reverb.
M / S	Mute and solo.
Master	Overall gain and the reverb return level.

> **MIXING ORDER THAT WORKS** Set volumes first with the drums and bass; add the mids until the chords sit comfortably; bring in vocals; then use EQ to clear space (cut low end on non-bass parts, soften harshness in the high band) and use reverb/delay sparingly — more on sounds that should sit *back*, less on sounds that should be *up front*.

9 · Words view — poems and lyrics

Words: the poem on the left, the timed lines on the right. The current line is shown large and highlighted while the song plays.

Turn a poem into a song bed

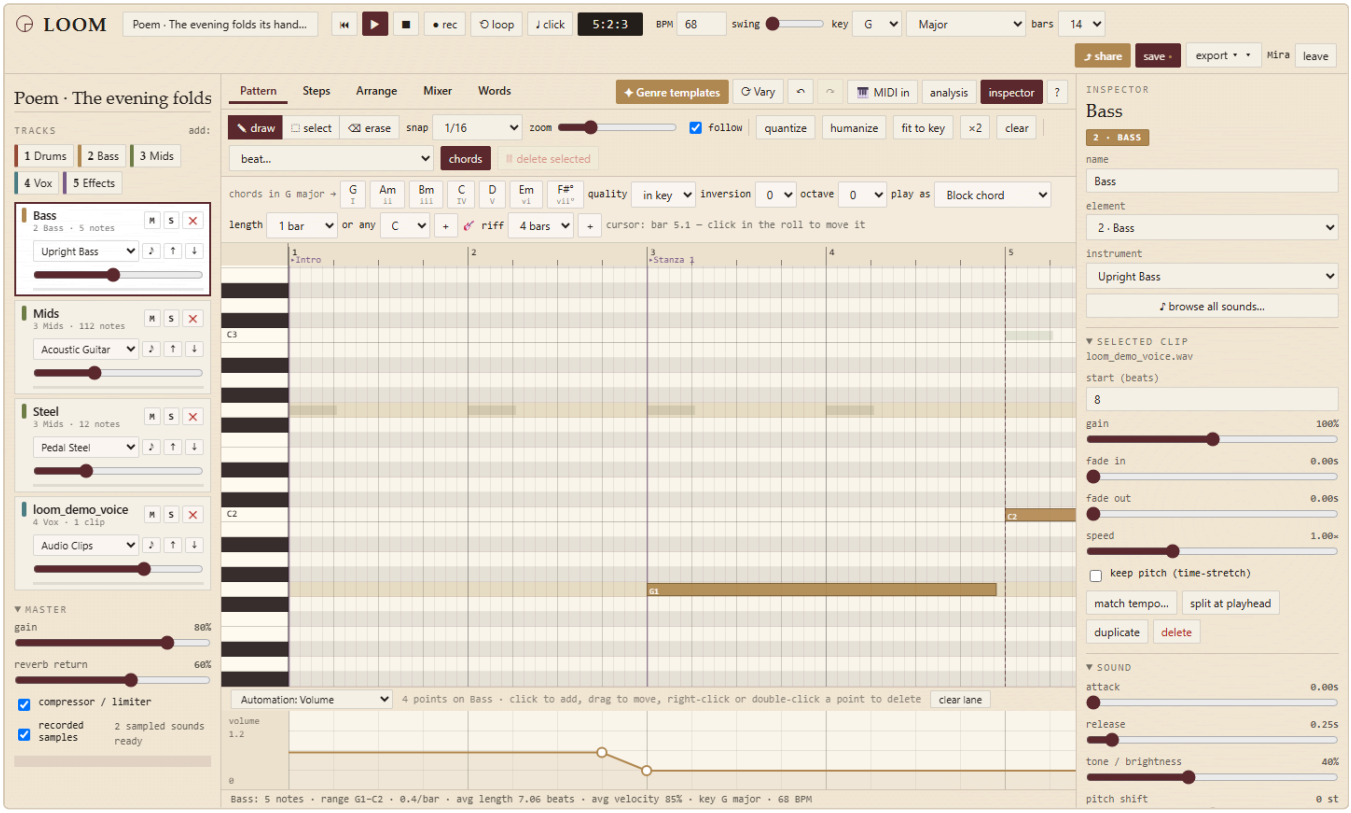

1. **Paste or write the poem.** Leave a blank line between stanzas. Up to 400 lines. The status line shows lines, stanzas and the estimated length in bars and minutes.
2. **Choose a mood.** Soft Acoustic, Piano & Strings, Country Porch, Retro Tape, Late-Night Jazz, Ambient Air, Melancholy or Hopeful. Each sets tempo, key, sounds and chord pace.
3. **Choose a reading pace** (slow & dramatic, natural, brisk) and a **variation** number (🎲 picks another) and whether to build into a *new project* or replace this project's music (your recorded audio tracks are kept).
4. **Press "Build music for this poem".** LOOM makes an Intro, one section per stanza and an Outro. Each line gets as many bars as a natural reading needs at that tempo (at least one). The bed has bass, guitar or piano, a gentle second instrument and — in some moods — a barely-there pulse. It has **no vocal part**: the voice is yours.

Read it over the music

- ● **Record my reading** — creates a *Voice* track, places the playhead at your first line, starts the music and records your microphone. Press stop when you finish; the take lands on the Voice track where your first line begins. Use headphones so the music does not leak into the microphone.
- ⤒ **Import my reading…** — use a recording you already have; it is placed at your first line.
- Drag the clip in Arrange if your reading does not line up with the sections.

Duck the music under your voice

Duck music under my voice looks at every voice clip and writes a volume curve on every music track: a smooth 1-beat ramp down to 60%, 45% (default) or 30% just before you speak, held while you speak, then a smooth ramp back up. Because the curves are ordinary volume automation, you can refine them in Pattern (lane “Volume”). **Remove ducking** clears them. If you move the voice clip afterwards, press the button again.

The ducking curve shown in the volume lane under the piano roll: normal level, a dip under the voice, then back.

Lyrics everywhere

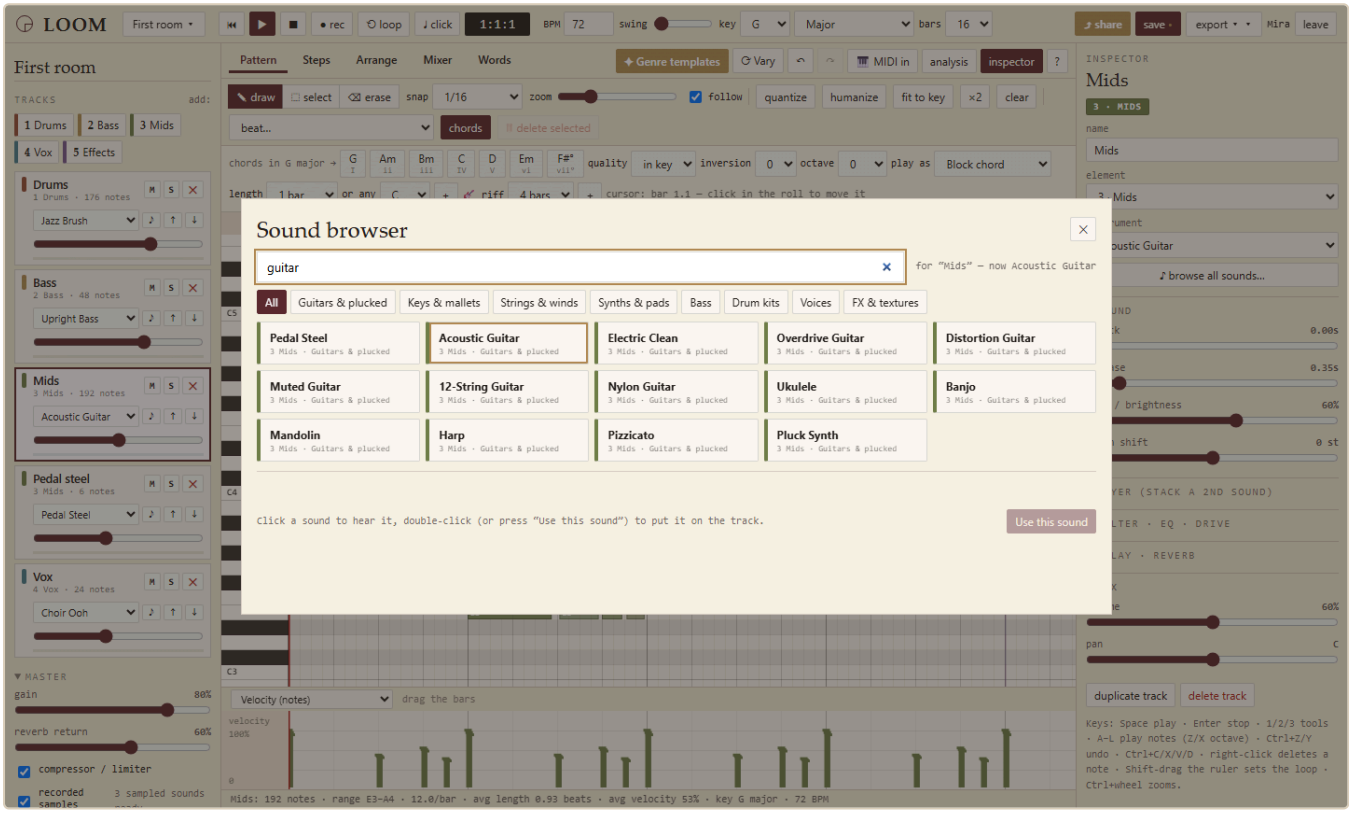

- Click any line to jump to it. In the studio and on the public share page the current line follows the playhead.
- **Export lyrics (.lrc)** gives time-stamped lyrics for music players; **Export subtitles (.srt)** gives subtitle timings for video editors.
- The poem text and mood are saved with the project, so you can come back, edit the words and build again.

> **HOW ACCURATE IS THE TIMING?** Line times come from a syllable count and the pace you chose — a reasonable reader's pace, not an analysis of your recording. Treat them as a good starting grid and move your clip (or the sections) if your performance differs.

10 · Sounds, samples and effects

Choosing a sound

- The **dropdown on a track card** lists the sounds of that track's element.
- **♪ (sound browser)** lists all 77 sounds in categories (Guitars & plucked, Keys & mallets, Strings & winds, Synths & pads, Bass, Drum kits, Voices, FX & textures) with search. *Click once to hear it; double-click (or "Use this sound") to apply it.* The audition plays a short phrase suited to the sound (a chord, a bass line, a drum pattern).

The sound browser, searched for "guitar".

Recorded samples or synth?

31 instruments and three drum kits have real recordings (grand piano, Rhodes, clavinet, steel/nylon/clean/overdriven/distorted/muted guitars, banjo, harp, pizzicato, three basses, marimba, vibraphone, music box, kalimba, violin, cello, strings, trumpet, sax, flute, brass, accordion, organ, two choirs, warm pad; Acoustic Kit from recorded drums plus Linn and CR-78 kits). All 77 can be synthesised.

Situation	What you hear
recorded samples on (default) and loaded	The recording, pitch-shifted to your note. Plucked/struck sounds ring and fade naturally; held sounds (strings, brass, choir, organ) loop smoothly when a note lasts longer than the recording.

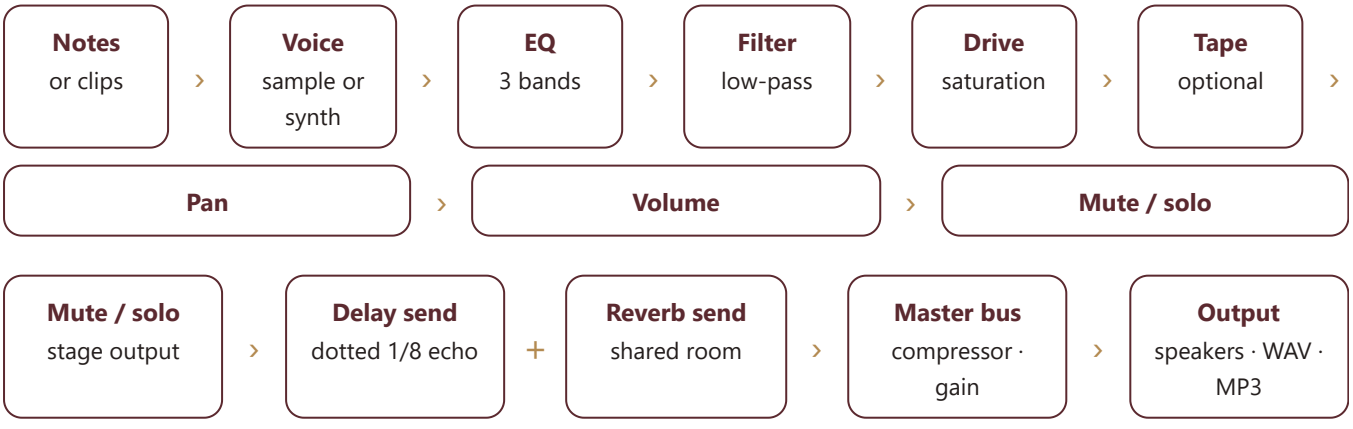

still loading, or note outside the recorded range, or a drum lane the recorded kit lacks (e.g. no clap in the acoustic kit)	The synthesiser fills in, note by note — nothing goes silent.
recorded samples off (master panel)	Synth only. Smaller download, original LOOM sound.

The status text beside the switch says how many sampled sounds are ready. Samples are fetched only for sounds your project uses.

The inspector's sound controls

Control	What it changes
attack	How slowly a sound fades in (long = pad-like, short = plucked).
release / decay	How long a sound lingers after the note ends (for drums: how long the hit rings).
tone / brightness	Opens or closes the high end of the voice.
pitch shift	Transposes the whole track up to ±24 semitones.
layer	Stacks a second sound on exactly the same notes (pad + pluck, a bass an octave up…) with its own level and a −12 / −7 / 0 / +7 / +12 semitone shift.
filter · EQ · drive · tape	Low-pass filter; three-band EQ; **drive** (soft-clip saturation, from warm to crunchy); **tape wobble & warmth** (slow pitch wander, fast flutter and a softer top end — the "old cassette" feel).
delay · reverb	Send levels to the shared echo and reverb.
volume · pan	Level and stereo position.

The signal path of every track

11 · Writing music faster

Genre templates

The ✦ **Genre templates** dialog lists 64 styles in families: *Country* (ballad, honky-tonk, bluegrass, outlaw, country-pop, western), *Acoustic & soothing* (lullaby, soothing acoustic, morning coffee, Sunday folk), *Retro* (70s soul, 80s pop, doo-wop, rockabilly, tape dreams, lounge), *Jazz* (ballad, smooth, cool, big-band swing), *Poetry & spoken word* (eight moods), and hip hop, house/dance, rock/guitar, groove, breaks, world and cinematic styles.

- Choose **into: a new project** (safe) or **replace this project's tracks** (your imported/recorded audio tracks are kept).
- **variation** — a number from 1–99999; the same number always makes the same song. 🎲 picks one at random.
- ⟳ **Vary** (in the tab bar) rewrites the notes of the template tracks with a new variation while keeping your sounds, mix, key, tempo and anything you added.
- Each template is a 16-bar song with named sections and a chord progression. Different sections include different parts: for example an intro may have only keys and light percussion, the chorus all five elements.

Beats

Beats are described as drum patterns of 16 steps per bar with accents (loud), normal and ghost (quiet) hits, plus optional *fills* and *lead-in crashes*. The **beat…** menu in Pattern and Steps writes one into the selected drum track for the whole song.

Other time-savers

Feature	When to use it
fit to key	You pasted or played notes and a few are “wrong”.
quantize / humanize	Tighten a loose recording, or loosen a rigid pattern.
arpeggiate	Turn a held chord into a flowing pattern.
duplicate range (Arrange)	Build structure: copy a verse, then change the copy.
layer	Make one part bigger without writing it twice.
copy / paste / duplicate (`Ctrl` + `C` `V` `D`)	Reuse a lick or a drum fill.

12 · Voice and audio clips

Recording a vocal or instrument

1. Add a **Vox** track and set its sound to *Audio Clips* (or select an existing audio track).
2. Put the playhead where you want to begin and press ● **record vocal** in the inspector (or in Arrange). Your browser asks for microphone permission the first time.
3. The rest of the song plays while you record — **wear headphones**, otherwise the speakers bleed into the microphone.
4. Press ■ **stop take**. The take appears as a clip and is uploaded to your project so it is there next time.

Echo cancellation, noise suppression and automatic gain are switched off so you get the raw signal; trim or fade the ends in Arrange. There is no latency compensation: if your take sits slightly late, drag the clip a little earlier or set its *start (beats)* in the inspector.

The selected-clip controls

Control	Meaning
start (beats)	Exact position of the clip on the timeline.
gain	Clip level, 0–200%.
fade in / fade out	Linear fades up to 8 seconds; use them to hide edits and crossfade overlapping clips.
speed	0.5×–2×. Without "keep pitch" it behaves like tape: faster = higher, slower = lower.
keep pitch (time-stretch)	Changes the speed *without* changing pitch: a voice stays a voice. LOOM computes a stretched copy in the browser the first time it is needed (the note "stretching…" shows while it works). Best between about 0.7× and 1.5×.
match tempo…	Enter the tempo (BPM) the audio was recorded at; LOOM sets the speed so it lines up with the project and switches "keep pitch" on.
split · duplicate · delete	Edit clips like pieces of tape.

> **STORAGE** Audio lives on the server with the project, so it follows you between devices. Limits: 12 MB per file, 40 files and 60 MB per project. Recorded or imported audio is not synthetic: everything you upload is yours to manage; deleting a project deletes its audio.

13 · Automation

Automation makes a setting change over time: a filter that opens through a build-up, a pad that fades in, a sound that drifts across the stereo field, or music that dips under a voice.

1. Select a track and open **Pattern**.
2. In the strip under the roll, change the dropdown from *Velocity (notes)* to **Automation: Volume / Filter / Pan / Reverb send / Delay send**.
3. **Click** to add a point; **drag** a point to move it (it snaps to the grid in time); **right-click or double-click** a point to delete it; **clear lane** removes the whole lane.

Between points the value ramps in a straight line; before the first point and after the last it holds the first/last value. While a lane exists, the lane owns that setting and the knob is ignored for it (the dashed line shows the knob's value when there is no lane). Playback that starts in the middle of the song, or a loop restarting, begins at the lane's value at that moment. Automation is saved with the project and included in WAV/MP3/stem exports and on the public share page. Mute and solo always win over automated volume.

14 · Transport, recording and MIDI

Playing and looping

- Press play from anywhere: click the ruler first. `Home` returns to the start (or the loop start).
- **Loop**: `Shift`-drag a ruler to define the region, press ⟲ **loop**. Playback wraps without a gap; long clips and automation continue correctly across the wrap.
- Changing tempo while playing re-times the song smoothly.

Playing notes

- **Computer keyboard** — letters `A` `W` `S` `E` `D` `F` `T` `G` `Y` `H` `U` `J` `K` `O` `L` `P` `;` are piano keys; `Z`/`X` change octave. On a drum track the same keys play the drums (kick, rim, snare, clap, toms, hats…).
- **MIDI keyboard** — press 🎹 **MIDI in** and allow the browser's MIDI permission (Chrome, Edge, Brave). Velocity from the keys is used.
- **Recording** — arm ● **rec**, press play, and play. Each note starts on the nearest grid step and lasts as long as you hold it. Recording works on pitched and drum tracks (not on audio tracks).

Importing MIDI

project ▸ › *Import MIDI file…* reads a standard MIDI file: each channel becomes a track (channel 10 becomes drums; others become bass, mids or vox depending on the program and pitch range), tempo is taken from the file, and the song is lengthened if needed (up to 24 tracks and 20,000 notes).

15 · Saving, history, import and export

Saving and history

- **save** writes the project to the server; a dot appears on the button while you have unsaved changes, and your browser warns before you leave with unsaved work.
- **Version history** (*project ▾ › Version history*) keeps the last 40 saves. Each row says **who saved it** and **what changed** in plain words ("tempo 78 → 90", "Drums: +14 notes", "added track Guitar", "Vocals: muted"). **restore** brings an old version back as a new save — nothing is lost.

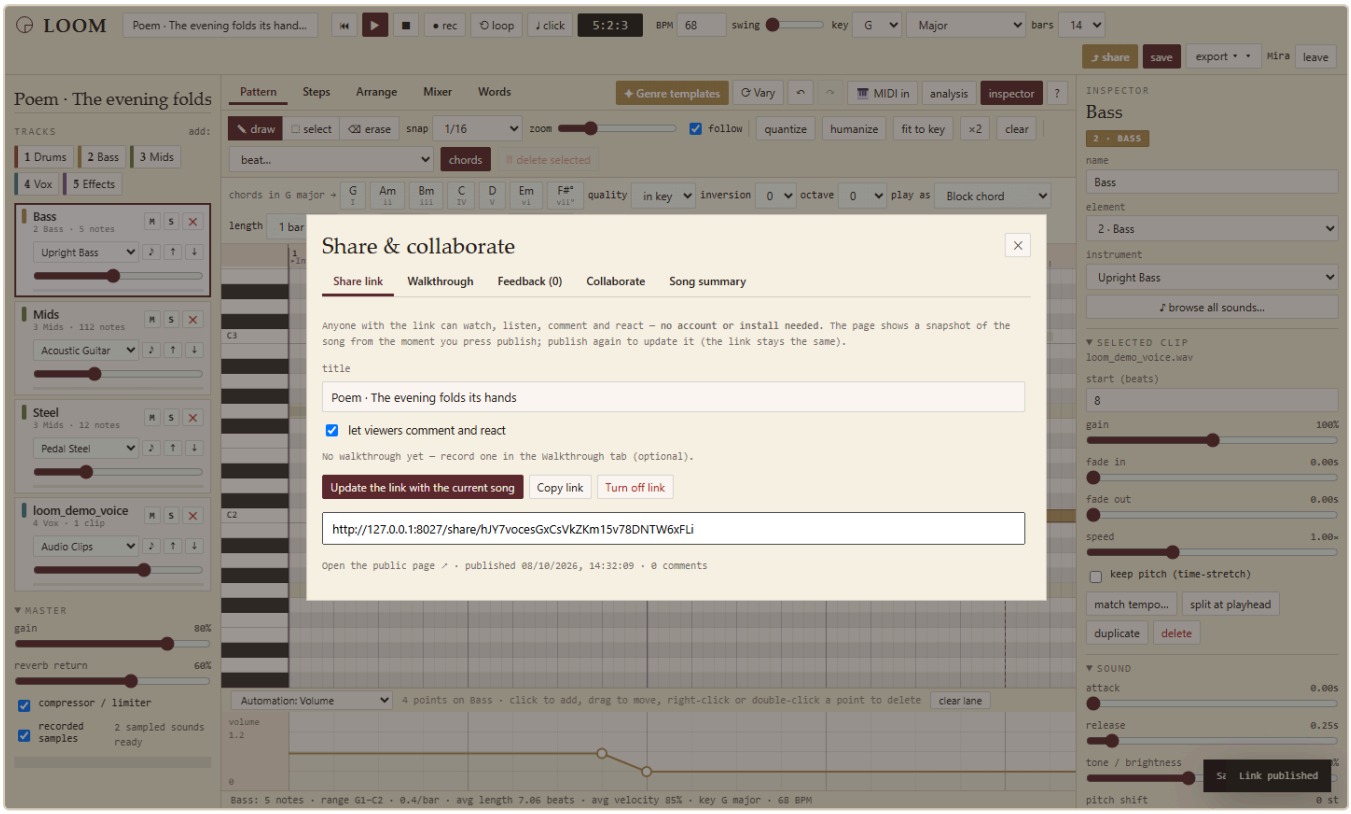

Exporting

Export	What you get
MIDI file	All tracks with notes, a tempo track, your section names as markers, General-MIDI sound numbers, drums on channel 10. Audio clips are not included (MIDI has no audio).
WAV mix	A 16-bit stereo 44.1 kHz render of the loop region (if loop is on) or the whole song, plus a 2.5-second tail so reverb finishes. If the mix would clip, the level is reduced just enough to avoid it.
MP3 mix	The same render encoded at 192 kbps with the LAME encoder (downloaded only when you use this).
Stems	One WAV per track (soloed, with its own effects) so you can finish a mix in another program. Your browser may ask permission to download several files.
Lyrics (.lrc, .srt)	From the Words tab (chapter 9).

> **RENDER TIME** Exports are rendered faster than real time on most computers, but a 16-bar song with many tracks can take tens of seconds on a busy or slow machine. Stay on the page; LOOM tells you when it is done.

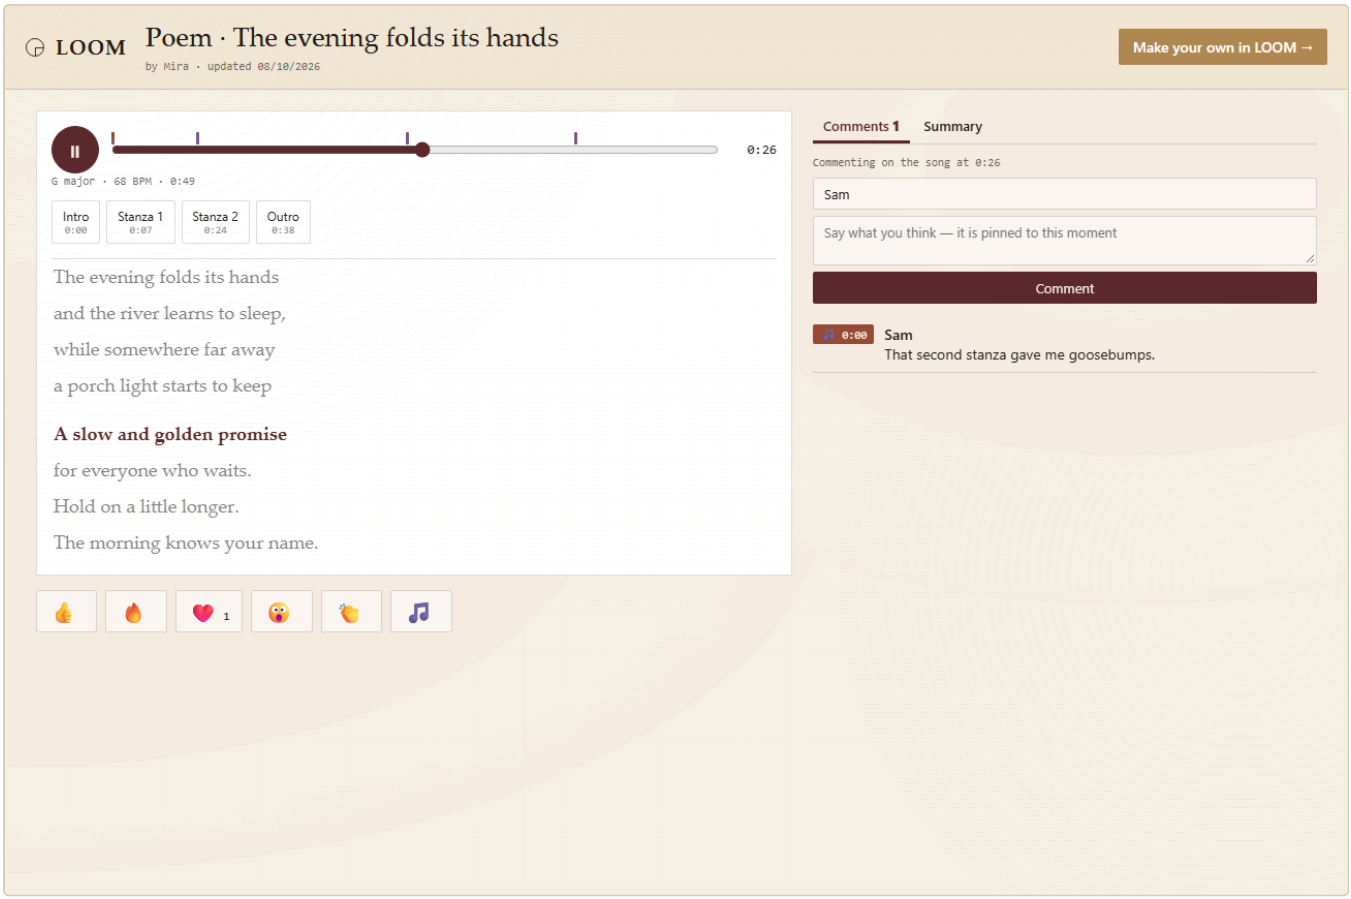

16 · Share and collaborate

The share link

The share dialog: title, comment switch, walkthrough status and the link.

1. Click ⤴ **share** › **Publish link**. LOOM saves, takes a **snapshot** of the song at that moment and gives you a link.
2. Anyone with the link can play it, read the summary, comment and react — **no account or install**. Later edits stay private until you press **Update the link with the current song** (the link itself never changes).
3. **Turn off link** deletes the page together with its comments and reactions. You can publish a new link later.

What a visitor sees: the player with section buttons, the lyrics following the music, reactions, and a comment pinned to a moment.

What viewers can do

- Play, pause and seek the song (it plays live in their browser, so it starts instantly) and jump to sections; follow the lyrics if there are any.
- **Comment on an exact second** — a comment is pinned to the time the viewer is at in the song or in the walkthrough video; clicking its time chip jumps there. Name is optional.
- **React** with 👍 🔥 ❤️ 😮 👏 🎵 (a small emoji floats up).
- Read the **summary**: key, tempo, length, the chords of each section (detected from the notes) and which tracks play where; search and click the **transcript** of a walkthrough.

You see all comments and reaction counts in **share › Feedback**, where you can delete any comment, and you can switch comments off.

Walkthrough recorder

Show a collaborator *how* a song is built. **share › Walkthrough › Start recording** captures your screen (choose "this tab"), optionally with:

- **narration** from your microphone,
- a **camera bubble** in the corner,
- the **song's sound** (tick "share tab audio" when the browser asks),
- an automatic **transcript** using your browser's speech recognition. *In Chrome this sends the audio to Google's service to transcribe it; leave it off if that matters.*

Recording stops with ■ **stop** or after four minutes. Preview it, then **Publish & copy link**; it is uploaded (up to 48 MB) and attached to the link, and the public page shows the video above the song with the transcript in a side tab. Needs Chrome, Edge or Brave on a computer.

Collaborating

- **share › Collaborate › invite by email** — the person must already have a LOOM account. They then see your song in their project list ("shared by …") and can edit it, record into it and add audio. Only you can delete it, share it or manage people. They can *leave* a project at any time; you can remove anyone.
- **Live sync** — LOOM checks for newer saves every few seconds (every 15 s when you are alone). If you have *no* unsaved changes, a collaborator's save appears automatically; names of people currently in the song show beside the share button.
- **Never overwritten** — every save says which version it started from. If someone saved first you see "Someone saved first" with three choices: *Load their version*, *Keep both — save mine as a new project*, or *Overwrite with mine*. With unsaved edits of your own you also get a banner before you try to save.

> **NOT GOOGLE-DOCS-STYLE** Collaboration syncs whole saves, not every keystroke. Agree who edits what, save often, and use sections/tracks to stay out of each other's way.

17 · Keyboard shortcuts

Playing	
`Space`	Play / pause
`Enter`	Stop and rewind
`Home`	Back to the start (or loop start)
`Shift`-drag on a ruler	Set the loop region
`Ctrl`+wheel	Zoom the roll or the timeline
Writing and editing	
`1` `2` `3`	Draw / select / erase tools
`A`–`L` keys, `Z` `X`	Play notes; change octave
Right-click a note	Delete it
`Delete`	Delete selected notes (or the selected clip in Arrange)
`Ctrl`+`A` / `C` / `X` / `V` / `D`	Select all / copy / cut / paste at the playhead / duplicate
`↑` `↓` `←` `→`	Nudge selected notes by a semitone or a snap step (`Shift` = an octave)
`Ctrl`+`E`	Split the selected clip at the playhead
`Esc`	Clear the selection
General	
`Ctrl`+`Z` / `Ctrl`+`Y` (or `Ctrl`+`Shift`+`Z`)	Undo / redo (100 steps)
`Ctrl`+`S`	Save
`?`	Show the shortcut sheet

18 · Recipes

A country song with a country feel

1. ✦ Genre templates › *Country* › **Country Ballad** (slow, strummed) or **Honky-Tonk** (fast two-step); pick "a new project".
2. Keep *recorded samples* on: the acoustic guitar, upright bass, banjo and real brushed or acoustic drums carry the style.
3. Swap the lead for a **Pedal Steel** (slides into each note) or a **Violin** fiddle from the sound dropdown.
4. On the guitar track use the chord palette with *play as: Boom-chick* to write your own verse; the bass plays root and fifth on beats 1 and 3.
5. Add a touch of *reverb* to the steel and *delay* (a dotted-eighth echo) for a rockabilly slapback on guitar.

Poetry set to soothing acoustic music

1. **Words** › paste the poem › mood *Soft Acoustic* or *Country Porch* or *Piano & Strings* › **Build music**.
2. Play it. If the pace feels rushed, rebuild with "slow & dramatic".
3. **Record my reading** with headphones. Do one take per stanza if you like — place them in Arrange.
4. **Duck music under my voice** (45% is a good start), then check the dip in Pattern's Volume lane.
5. Add a gentle fade in on your first clip and a fade out on the last. Raise the reverb send on the Voice track a little for warmth.
6. Publish a link (lyrics follow along), or export **MP3** plus an **.srt** for a video.

Retro and tape-warm

- Templates: *Tape Dreams* (hazy), *Retro 70s Soul* (Rhodes, funk bass, tambourine), *Retro 80s Pop* (analog poly, gated feel), *Doo-Wop*, *Rockabilly*, *Retro Lounge*.
- Select a keys or pad track › inspector › **filter · EQ · drive · tape** › raise *tape wobble & warmth* to 30–60%. Add the *Vinyl Crackle* effect track for dust.
- Try the *Mellotron* (tape strings) layered under a Rhodes using the **layer** control.

Jazz

- Start from *Jazz Ballad*, *Cool Jazz*, *Smooth Jazz* or *Big-Band Swing*. Swing is already set (30%+ for swing styles).
- Use chord qualities in the palette: *maj7, min7, 7, 9, min9, 6* — and try inversions for smoother movement between chords.
- Bass: *Upright Bass* walks in quarter notes; for a ballad lower the tempo to 55–65 BPM and shorten drums to brushes (the "Jazz Brush" kit).

Beat-first, hip-hop or dance

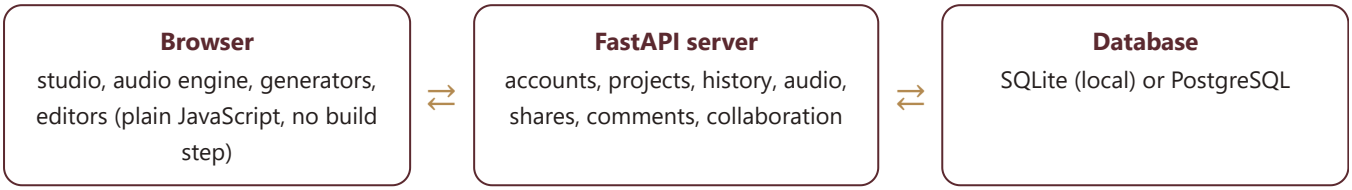

1. Add a drums track, open **Steps**, or use the *beat…* menu (Boom bap, Trap, Four on the floor…).
2. Add a bass (808 style = *Sub Bass*), then chords in Pattern with the palette.

3. Automate the filter on the chords over eight bars for a build-up; add a *Riser* in the effects element before the drop.

19 · How production works inside LOOM

This chapter explains what happens between “I clicked a note” and “I hear a song”, and how templates, poems and sharing are built. You do not need it to make music — it is here so the behaviour is predictable.

19.1 The big picture

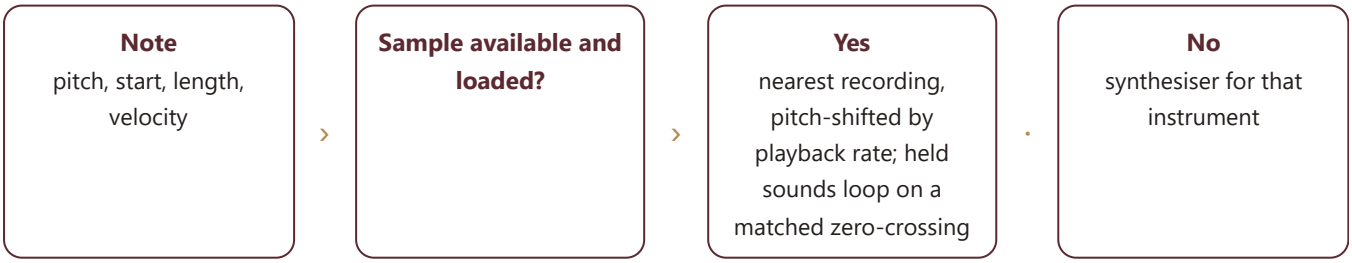

- **The sound is made in your browser** with the Web Audio API. The server never plays or generates audio; it stores and serves data (project JSON, uploaded audio, share pages).
- **A project is one JSON document**: tempo, swing, key, scale, bar count, sections, lyrics and poem text, master settings, and a list of tracks. Each track has its element, instrument, notes, audio clips, automation lanes, mix parameters, an optional layer, and mute/solo flags. Saving sends this document; version history stores up to 40 snapshots.
- **Audio files** are stored separately in the database and referenced by id from clips.

19.2 Making sound: the scheduler

Browsers are poor at precise timing from ordinary code, so LOOM uses the standard “look-ahead” technique. A timer wakes every 25 ms and schedules everything that falls in the next ~180 ms onto the audio clock, which is sample-accurate. For each track it schedules: notes (through the sample player or a synthesiser), audio clips (with fades, speed and time-stretch), and automation (as value ramps). Swing is applied when a note's time is computed. When a loop wraps, a second time anchor is added so scheduling continues seamlessly. On stop or seek, every track's output is disconnected, silencing already-scheduled sounds instantly, and fresh signal chains are rebuilt on demand.

19.3 Voices: samples first, synth as fallback

Recordings are kept every fourth semitone, so no note is shifted by more than two semitones. Each instrument's loudness is normalised when it loads so recordings sit at the same level as synthesised sounds. Drum kits map each drum lane to a one-shot; lanes a kit does not have use the synthesised drum. The synthesisers are written in code: oscillator banks with filters and envelopes, FM for electric piano and bass,

plucked-string physical modelling (Karplus-Strong) for guitars, formant filters for “voices”, noise for percussion and effects.

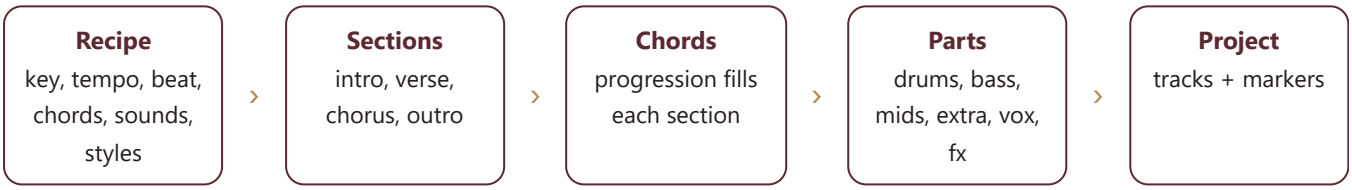

19.4 Effects and the mix

Every track owns a small chain of audio nodes (see chapter 10's diagram). The shared reverb is an algorithmic design (parallel damped feedback combs into all-pass diffusers) chosen because it costs a fraction of a convolution reverb; its damping filters are deliberately set so the loop can never grow. The delay time follows the tempo. The master bus has a compressor/limiter, a gain, and an analyser that drives the meters and the scope.

19.5 Offline rendering (WAV, MP3, stems, tests)

An export builds the same graph in an *offline* audio context and schedules the whole song at once, so it uses exactly the same voices, samples, effects and automation as live playback, then converts the result to WAV (16-bit) or MP3. Because the same code is used everywhere, what you hear is what you export.

19.6 How a genre template becomes a song

1. **Recipe** (a plain data entry in `data/genres.json`): tempo, swing, root note, scale, a drum beat id, a drum kit, the chord progression (scale degree, optional quality, length in beats), and for each part an instrument and a *style* name.
2. **Structure**: a list of sections (name, bars, and which parts play — each part can be off, on, or “lite”).
3. **Chords**: the progression is repeated to fill each section. Degrees are turned into real chords by stacking thirds within the scale, unless the recipe names a quality (maj7, min9…). A *voicing* function places the notes close together near a comfortable register.
4. **Parts** are written by style functions: bass styles (root, root-fifth, offbeat, walking, 808, syncopated, slap, country boom-chick, shuffle, cumbia, amapiano and more), keyboard/guitar styles (block, sparse, comping, stabs, pad, arpeggios, folk/pop/ballad strums, fingerpicking, palm-mute chugs, power chords), voices (pads, chops), melodies (a hook motif that repeats, with a fresh answer phrase every fourth bar) and guitar riffs (pentatonic). Drums come from the beat table with fills and crash lead-ins.
5. **Effects**: an impact on each new section and a riser before a big one; optional texture (crackle, wind) across the song.
6. All randomness comes from a **seeded generator**: same recipe + same variation number = identical notes.

19.7 How a poem becomes a timeline

1. **Parse**: stanzas are separated by blank lines; each line is counted in words and syllables (a simple English syllable estimator).

2. **Pace**: at the chosen words-per-minute a line lasts *syllables ÷ syllables-per-second + a breath*. The mood's tempo gives the bar length, so each line is given the whole number of bars (minimum one) that covers that time.
3. **Layout**: an intro of two bars, then each stanza as a section whose length is the sum of its lines, then an outro; the total is rounded up to an even number of bars (and capped at 64; lines that do not fit are reported).
4. **Music bed**: the mood's recipe is run through the same generator, but with these sections, and with no vocal part; the bed sits lower in the mix so a voice has room.
5. **Ducking** reads the voice clips' start and end positions and writes volume curves that ramp down one beat before and back up one beat after, merging clips that are close together.

19.8 Time-stretch (keep pitch)

LOOM uses WSOLA (waveform-similarity overlap-add): the audio is cut into overlapping 46 ms windows, spaced further apart or closer together than the original to change the length, and each window is placed at the nearby position that best lines up with the previous one so the waveform stays in phase. Pitch is preserved because the windows themselves are not resampled. A search on a down-sampled copy keeps it fast.

19.9 Sharing, comments and collaboration under the hood

- A share is a row holding a random 192-bit token, a **frozen copy of the project**, an optional walkthrough video and a transcript. The public page and its media endpoints only ever expose that copy and the audio clips it references — other files in your project return “not found”.
- Comments and reactions need no account, so they are rate-limited per visitor and per page, length-limited, stripped of control characters and always displayed as plain text.
- Every project save sends the revision it started from; the server rejects a mismatch with HTTP 409 and tells the browser who saved last, which produces the conflict dialog. A small status request every few seconds reports the latest revision and who is present.

19.10 The server API (summary)

Area	Endpoints
Accounts	`/api/auth/bootstrap, signup, login, logout, me` — Argon2id password hashes, server-side session tokens stored hashed, CSRF token on every change.
Projects	`GET/POST /api/projects`, `GET/PUT/DELETE /api/projects/{id}`, `…/versions`, `…/versions/{n}`, `…/versions/{n}/restore`, `…/status`. State is capped at 1 MB per save.
Audio	`…/audio` (list, upload — type checked from the file's first bytes — and delete) with per-file and per-project limits; walkthrough videos use the same endpoint with a video flag.
Collaboration	`…/collaborators` (list, invite by email, remove).
Sharing	`…/share` (publish, read, revoke), `…/share/comments/{id}`; public: `/api/public/{token}`, `/media/{id}` (Range supported for video), `/comments`, `/reactions`; page `/share/{token}`.

Data	`/api/genres`, `/api/beats`, `/api/analyze` (note statistics), plus the original archive and style endpoints.

19.11 Files that matter

Path	What it contains
backend/app.py, core.py	The FastAPI app and the database models.
frontend/studio.html	The studio page.
assets/studio.js	Project state, transport and scheduler, piano roll, inspector, import/export, project I/O.
assets/studio-audio.js	The audio engine: tracks, effects, all synthesised instruments, sample player, automation, time-stretch, offline render.
assets/studio-gen.js	Music logic: chords, voicings, beat expansion, genre generator, strums, riffs, poems, ducking, MIDI read/write, summaries and diffs. No browser dependencies, so it is unit-tested in Node.
assets/studio-views.js, -sounds.js, -share.js, -words.js	Chord palette, Steps, Arrange, Mixer, genre dialog; sound browser and help; share, walkthrough, collaboration, history; the Words tab.
assets/share.js	The public share page.
assets/samples/, vendor/	Recorded samples with credits; the MP3 encoder with its licence.
data/genres.json, beats.json	The styles and drum beats — edit these to add your own.
tests/, tools/	Automated tests; the script that builds the sample library.

> **ADDING YOUR OWN STYLE** Open `data/genres.json`, copy an entry, change its `id`, `name`, tempo, key, beat, chords and sounds, and reload LOOM — it appears in the template dialog. Style names must be ones the generator knows (see `studio-gen.js`); a test checks that every sound you name exists.

20 · Installing, running and deploying

Run it on your computer

1. Install Python 3.12 or newer.
2. In the project folder: `python -m venv .venv`, activate it (`.venv\Scripts\activate` on Windows, `source .venv/bin/activate` elsewhere), then `pip install -r requirements.txt`.
3. `python -m uvicorn backend.app:app --host 127.0.0.1 --port 8000`, then open `http://127.0.0.1:8000`.

The first run creates a local SQLite database (`loom.db`). To use PostgreSQL, copy `.env.example` to `.env` and set `DATABASE_URL`. Behind HTTPS, set `COOKIE_SECURE=1`. A `Dockerfile`, `docker-compose.yml` and Kubernetes/Terraform examples are included.

Browser support

Playing, editing, sharing, public page	Current Chrome, Edge, Brave, Firefox, Safari.
Screen/walkthrough recording, speech transcript, MIDI keyboard	Chrome, Edge, Brave on a computer.
Microphone recording	Any browser with microphone permission (headphones recommended).

Running the tests

Command	Checks
python -m pytest -q	The server: accounts, ownership, projects, audio limits, sharing, comments, collaboration, conflicts, data files, sample library, licence files. Uses a temporary database.
node tests/gen.test.js	The music logic across all 64 styles × 3 variations: valid notes, key, register, determinism, strums, riffs, poems, ducking, MIDI round-trip, chord detection.
python tests/e2e/studio_flow.py	Drives the real studio in a browser (needs Playwright + Chromium) — editing, templates, samples, automation, poems, time-stretch, MP3, labels, and renders every style through the engine.
python tests/e2e/studio_share.py	Share link, public page, walkthrough recording (with fake devices), comments, two-person collaboration, conflicts and history.
python tests/e2e/instrument_levels.py	Renders all 77 instruments; flags silence, NaN or clipping.
python scripts/smoke.py	A quick sign-up → step grid → save check.

21 · Troubleshooting

No sound.	Browsers start audio only after you click or press a key — press play once. Check the master gain and that the track is not muted or another track is soloed (lit *S*).
Sounds seem thin at first.	Recorded sounds load in the background; until a sound is ready the synth plays. The note beside "recorded samples" says how many are ready.
A track's note is invisible in the roll.	The roll shows only the selected track's range; scroll up/down, or select the right track. Drum tracks show drum rows.
Recording is late or has echo.	Use headphones; then drag the clip a little earlier in Arrange (or set its start precisely in the inspector).
Microphone / camera / screen do nothing.	Allow the permission in the browser's address-bar prompt; screen capture works in Chrome-family browsers only.
Share link says "turned off".	The owner revoked it or deleted the project; publish again for a new link.
"Someone saved first".	A collaborator saved after you opened the project. Choose "keep both" if unsure — it never loses anything.
Export is slow.	It renders the whole song; shorten the loop region, close other heavy tabs, or export stems one at a time.
"Save failed: Project state is larger than 1000 KB".	Very large projects (tens of thousands of notes) hit the 1 MB limit; split the song into two projects.
Poem timing does not match my voice.	Rebuild with a different reading pace, or drag your clip / sections in Arrange.

22 · Limits, licences and credits

Limits

Tracks per project	24
Song length	64 bars (4/4 only)
Undo	100 steps; version history: 40 saves
Project size	1 MB of project data per save
Audio	12 MB per file; 40 files / 60 MB per project
Walkthrough video	48 MB each, 4 minutes; 6 videos / 150 MB per project
Poem	400 lines; must fit in 64 bars
Comments	500 characters; 300 per page; limited per visitor

Not (yet) in LOOM

Time signatures other than 4/4 (waltz, 6/8); pitch correction of vocals; third-party plug-ins or SoundFont import; real-time keystroke-level co-editing; automation of drive, EQ and instrument settings; computer-voice reading of a poem into the mix.

Licences and credits

- **LOOM's own code** is under the licence in the `LICENSE` file of the project.
- **Recorded melodic sounds** — FluidR3_GM soundfont by Frank Wen, Creative Commons Attribution 3.0, pre-rendered by the MIDI.js soundfont project.
- **Acoustic drums** — "Pearl Master Studio Pack 1" by *enoe*, Creative Commons Attribution 3.0.
- **LinnDrum LM-2 and Roland CR-78 one-shots** — labelled "Public Domain" by the *oramics/sampled* collection; LOOM could not independently verify their provenance. A TR-909 set in the same collection states no licence and is not included.
- **MP3 encoding** — the LAME encoder via *lamejs*, LGPL-3.0, shipped unmodified as its own file and loaded only when you export an MP3.
- Full credits: `frontend/assets/samples/CREDITS.md` and `frontend/assets/vendor/README.md`. Keep them with any copy of LOOM you distribute.

> **YOUR OWN RECORDINGS AND WORDS** Poems, vocals, projects and comments you create belong to you. Only publish what you have the right to share; a share link is readable by anyone who has it.
